

17 April 2024

Agroforestry for the Future of European Agriculture Policy Summit

Session starts at 9am

The Square, Brussels

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement 862993.

SUMMIT AGENDA

Agroforestry for the Future of European Agriculture Policy Summit, 17 April 2024

This event is being livestreamed

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement 862993.

17 April 2024

Order of the Day

- Welcome
- Agroforestry in the European Context
- Introduction to World Cafe
- Coffee Break
- World Cafe Sessions
- Lunch
- Importance of peasant farming
- Results of morning session
- Debate
- Q&A
- Artistic interpretation
- Conclusions

The Square, Brussels

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement 862993.

Agroforestry for the Future of European Agriculture
Policy Summit, 17 April 2024

Welcome and Introduction

Boglárka Bozsogi

Communication & Policy Officer

Agroecology Europe

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement 862993.

Agroforestry for the Future of European Agriculture
Policy Summit, 17 April 2024

Welcome and Introduction

Professor Dr Ulrich Schmutz

AGROMIX Project Coordinator and Professor of Organic Horticulture and Ecological Economics, University of Coventry

Professor Tommy Dalgaard

Coordinator of EU project MIXED and Manager of the research section for Agricultural Systems and Sustainability, Aarhus University, Department of Agroecology

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement 862993.

Welcome to AGROMIX summit

Prof Dr Ulrich Schmutz, Coventry University
ulrich.schmutz@coventry.ac.uk

17th April 2024

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement 862993.

— All across Europe's climate extremes from
Iceland nearly in America to
Malta nearly in Africa,
is the answer
agromix* ?

*agroforestry with mixed farming

July 2023

March 2024

The
Agroforestry
Show

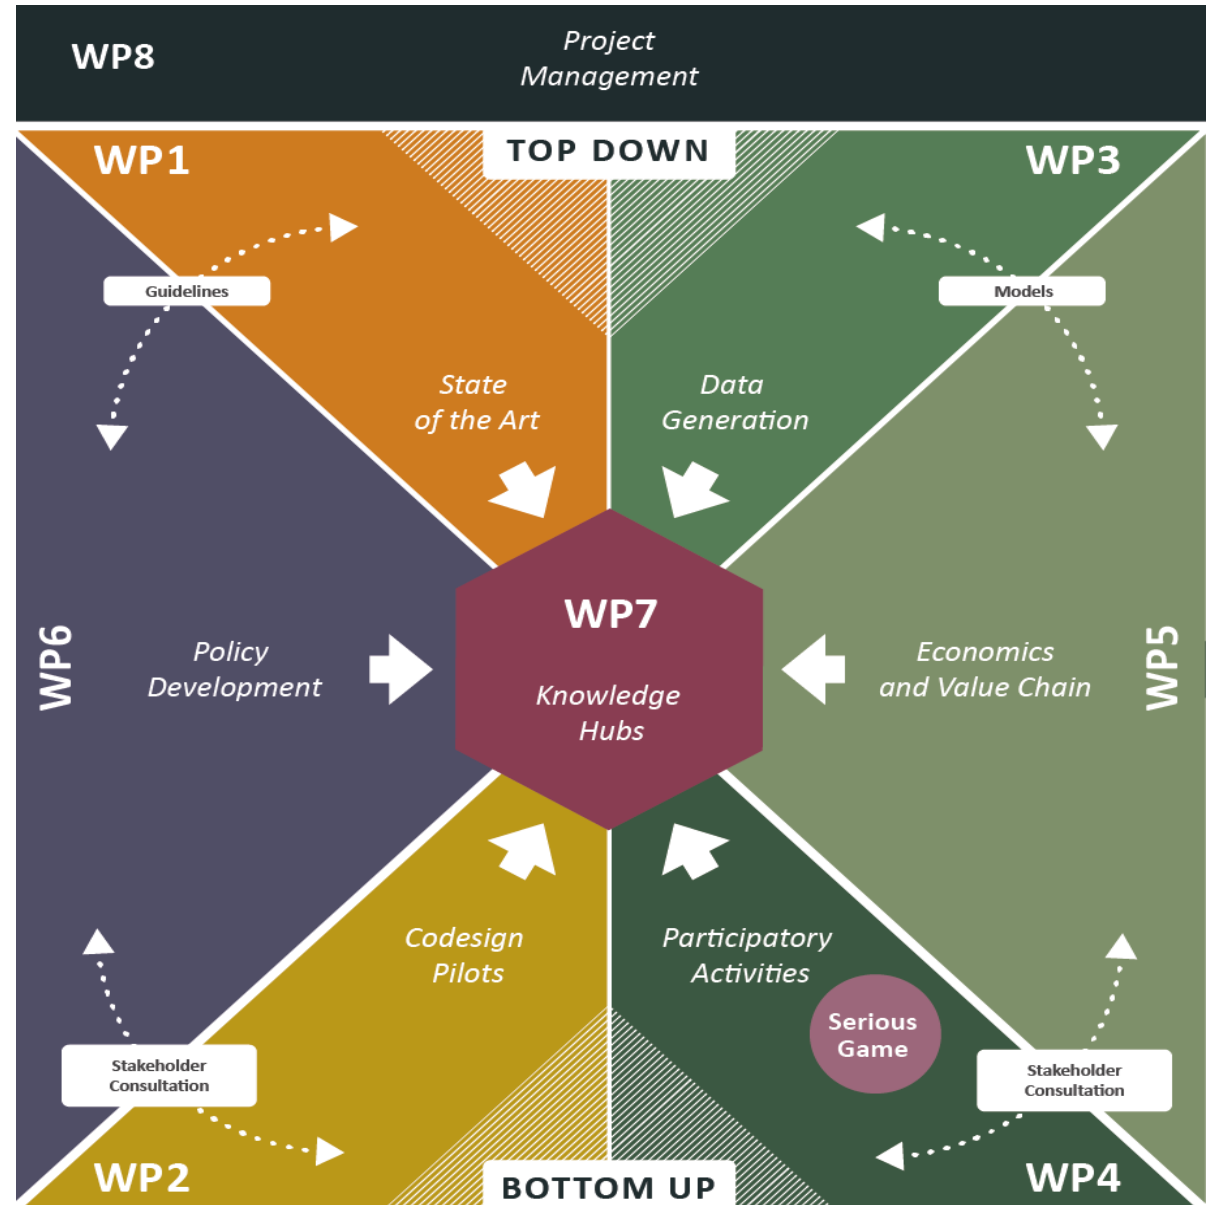

6 - 7 September 2023 • Eastbrook Farm, Wiltshire

project overview

- rooted in agroecology
- bio-physical data from replicated long-term **core sites**
- new co-design agroforestry pilots
- modelling (**crops & trees, climate, economic, policy**)
- **policy co-development**
- agroforestry innovation management

28 Partners:
 10 universities
 7 research institutes
 11 multi-actor partners

14 countries
 4 years, 2021 - Oct
 2024

€7m Horizon-2020
 RIA (Research and
 Innovation Action)

vision for today's summit

- Summit of stakeholders - not heads of states (bottom up)
- World Café Discussions and co-development
- Vision for a New Green Deal, **Greener** and co-designed for next EU-commission with **agroecology** and **agroforestry** at its heart

vision for next New Greener Deal?

- Increase **animal welfare** and **biodiversity** and make at least **20% agroforestry mandatory by 2050**
(for comparison in EU currently 8.8%, UK has 10% target)
- Increase policy target for certified agroecological (=organic) land use to **50% by 2050**
- **Simplify CAP** to support small-scale diverse mixed land use
- Fund **free advice and tree** establishment Europe wide
- Fund agroforestry **innovation actions** to improve marketing and supply chains

Project overview

- EU H2020 research and innovation project (October 2020 – February 2025)

The overall project objective is to: *support the development of European Mixed Farming and Agroforestry Systems (MiFAS) that optimize efficiency and resource use, reduce GHG emissions, and show greater resilience to climate change by considering agronomic, technical, environmental, economic, institutional, infrastructure and social advantages and constraints.*

- A multi-actor-project

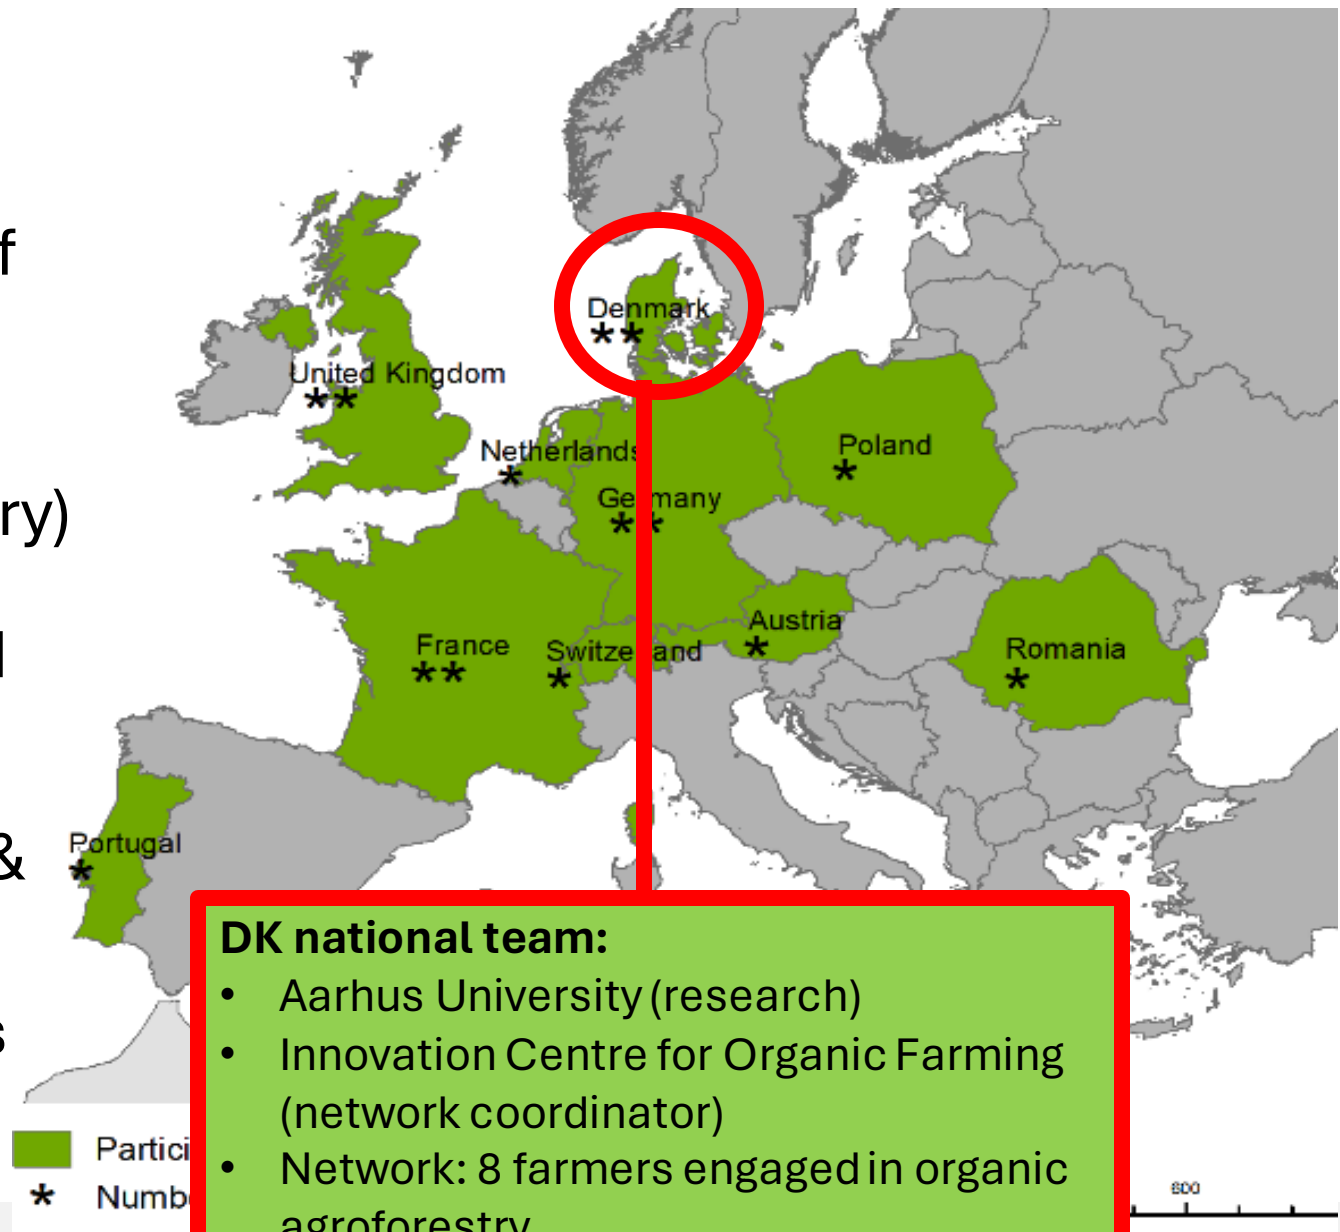

MIXED – a multi-actor project

A collaboration between networks of farmers, farmers' organisations/consultancies/NGOs and researchers.

In total 14 networks (7 on agroforestry) and 20 partners in 10 countries.

Participatory activities implemented in parallel by national teams in the 10 countries.

National teams: 1 research partner & 1-2 network coordinators collaborating with 1-2 networks of farmers (a total approx. 87 farmers in the project).

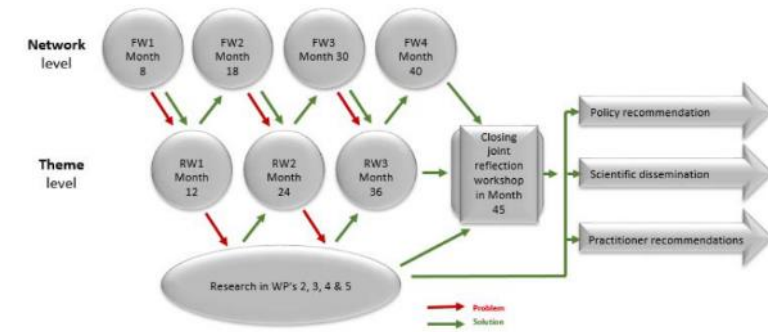

DK national team:

- Aarhus University (research)
- Innovation Centre for Organic Farming (network coordinator)
- Network: 8 farmers engaged in organic agroforestry
- Network: 12 farmers engaged in nutrient cycling and green biomass production

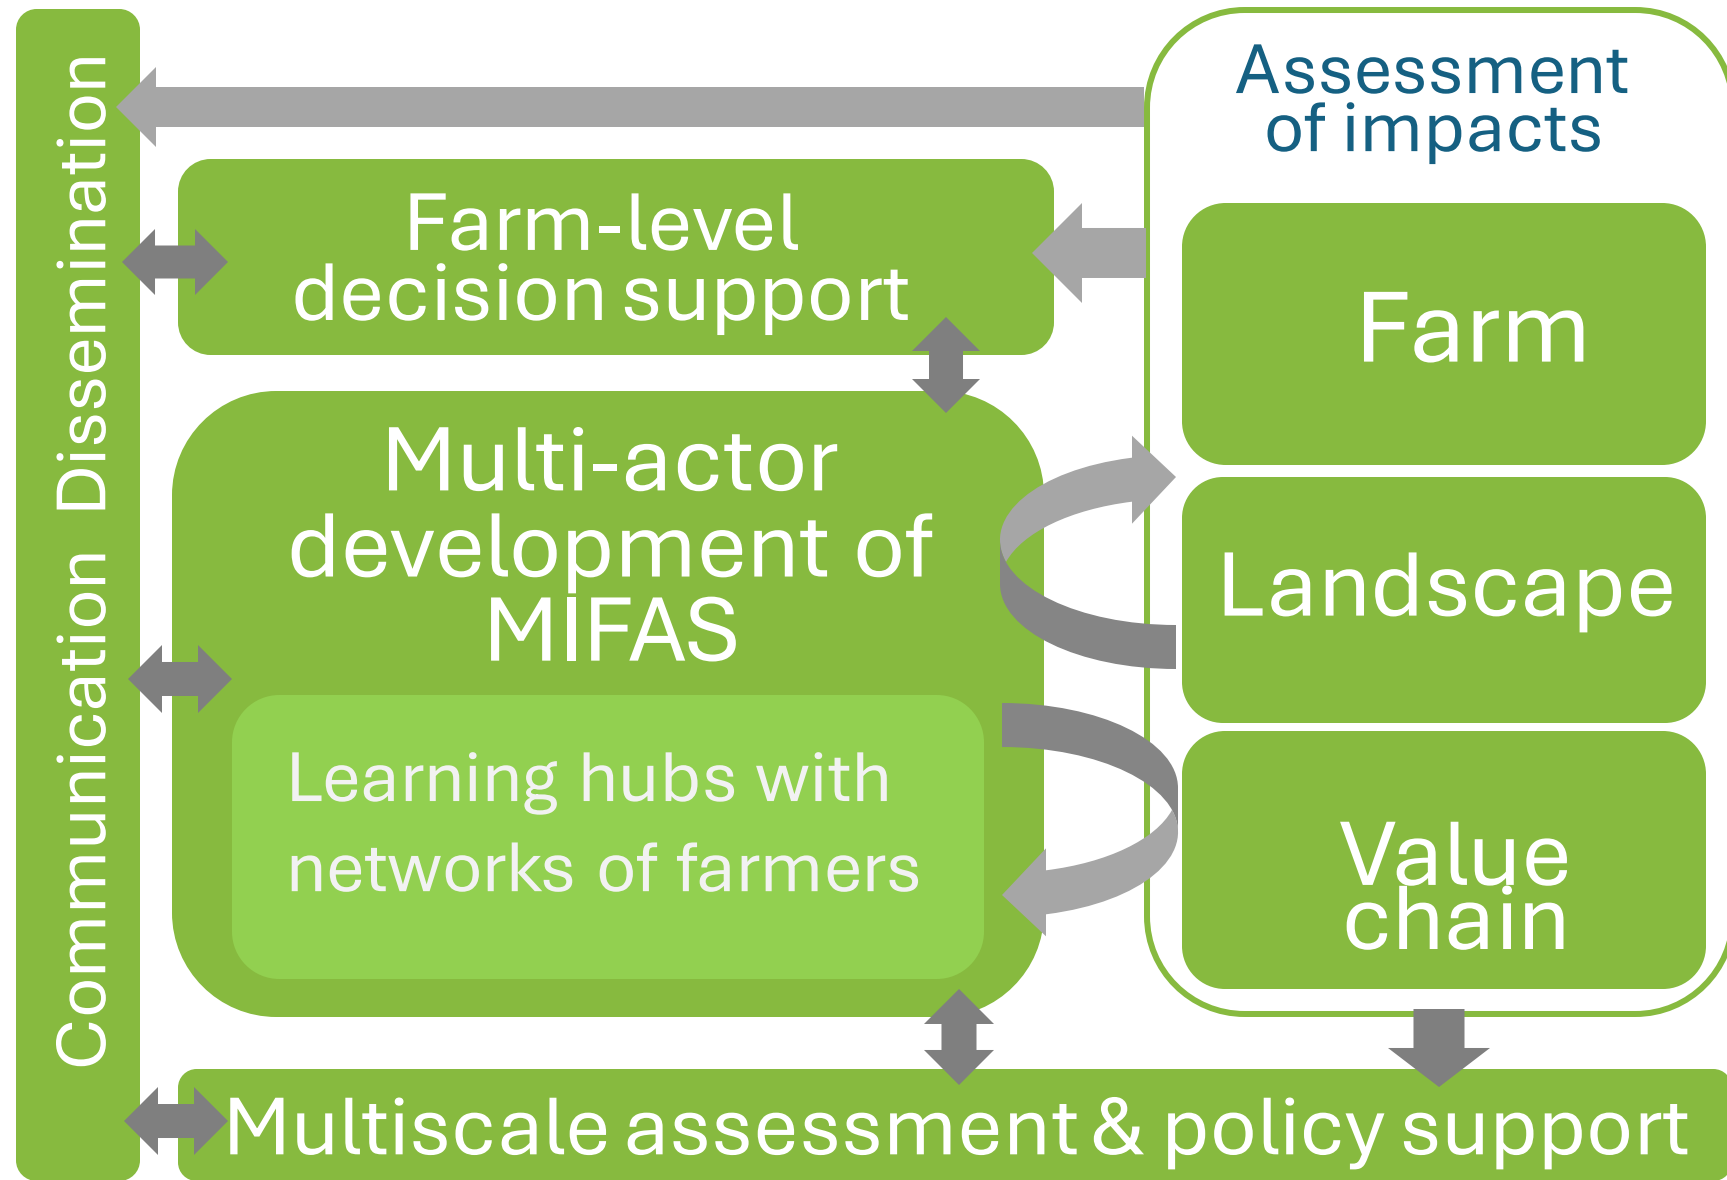

MIXED – multi-actor development of MiFAS

- *Learning hubs with networks of farmers.*
 - I. Arable crops ↔ livestock
 - II. Energy crops/fodder trees ↔ livestock
 - III. Fruit/nut trees/bushes ↔ livestock/arable crops
- *Alternating national field workshops and project level reflection workshops.*
- *Participatory design of mixed farming and agroforestry systems.*
- *Identification of solutions to barriers/bottlenecks at farm level, landscapes and value chains.*
- *Action research identified by networks.*

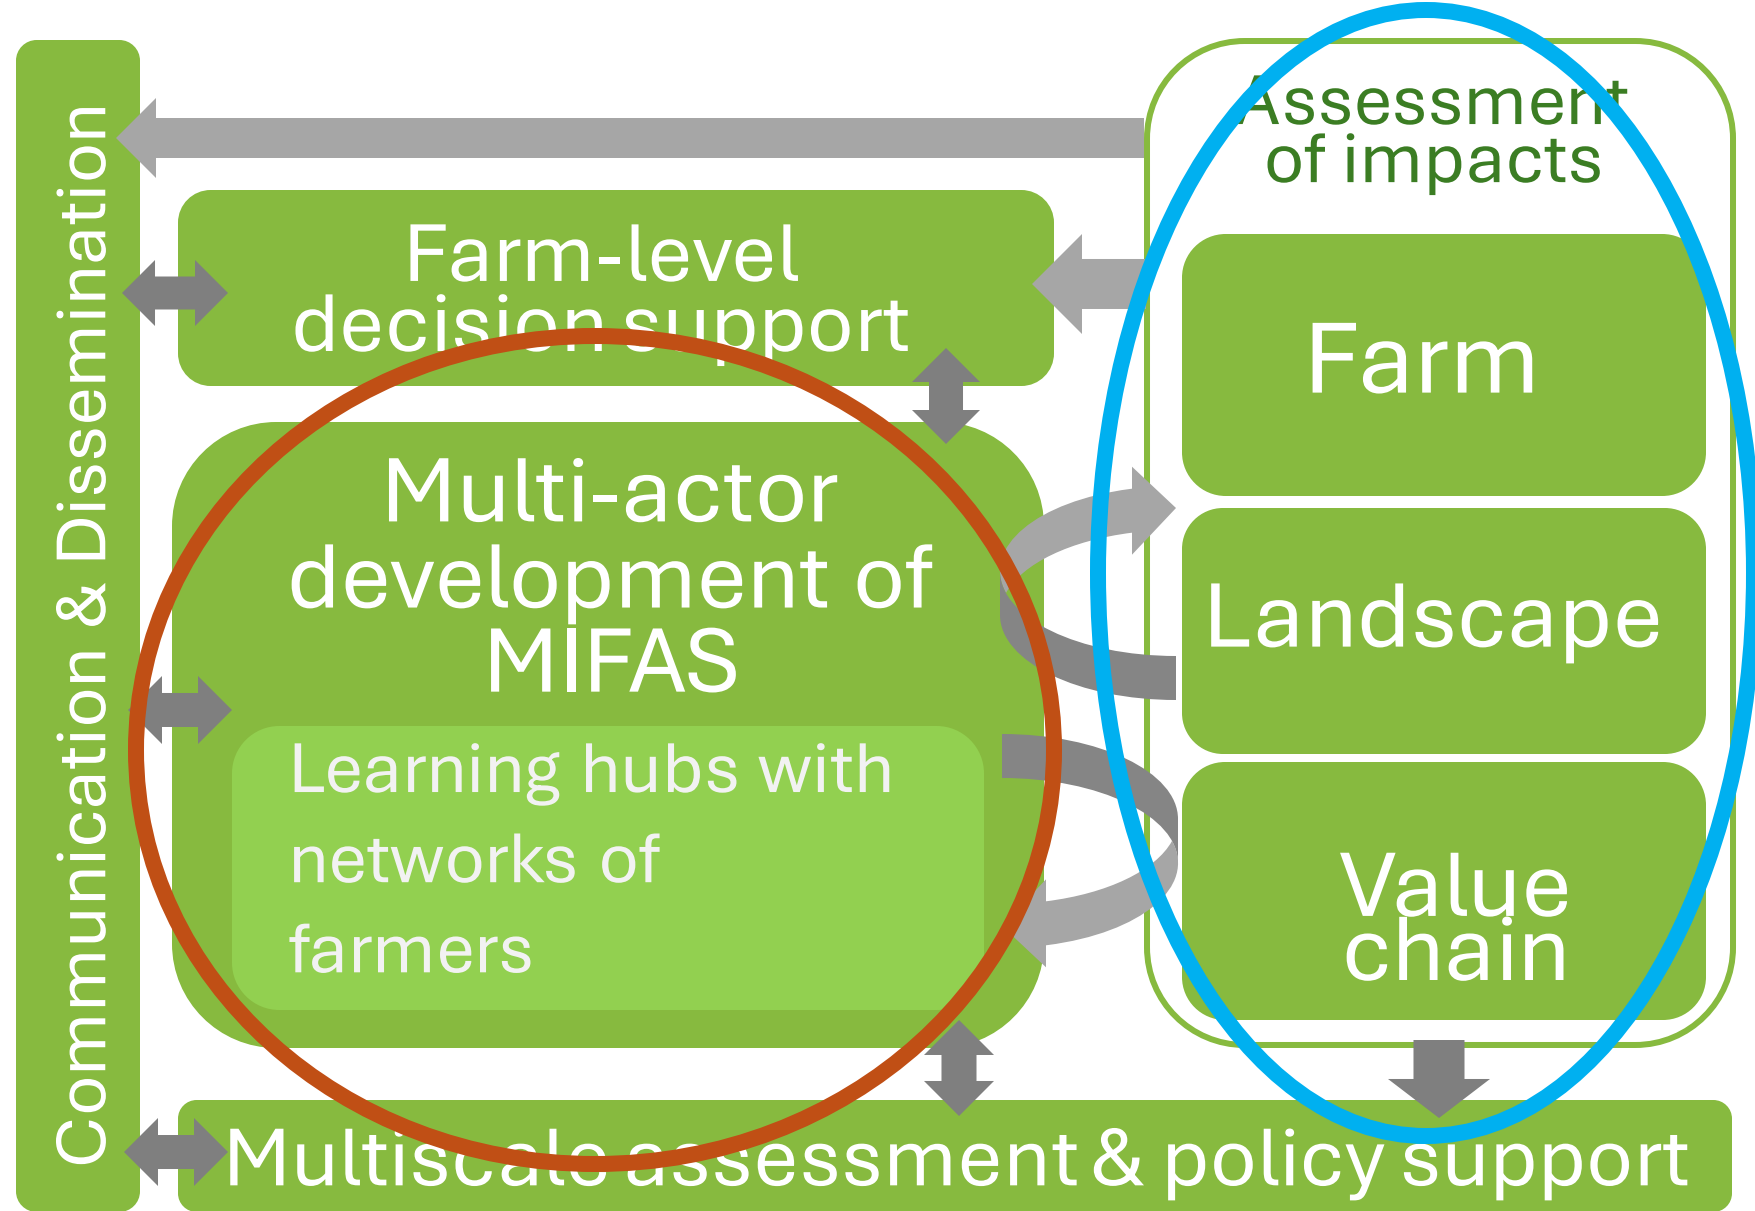

MIXED R&D

- Co-creation of knowledge and innovations for transition to MiFAS
- Development and assessments of benefits and trade-offs of MiFAS
- Decision support for farmers and multiscale assessments for policy support

MIXED R&D

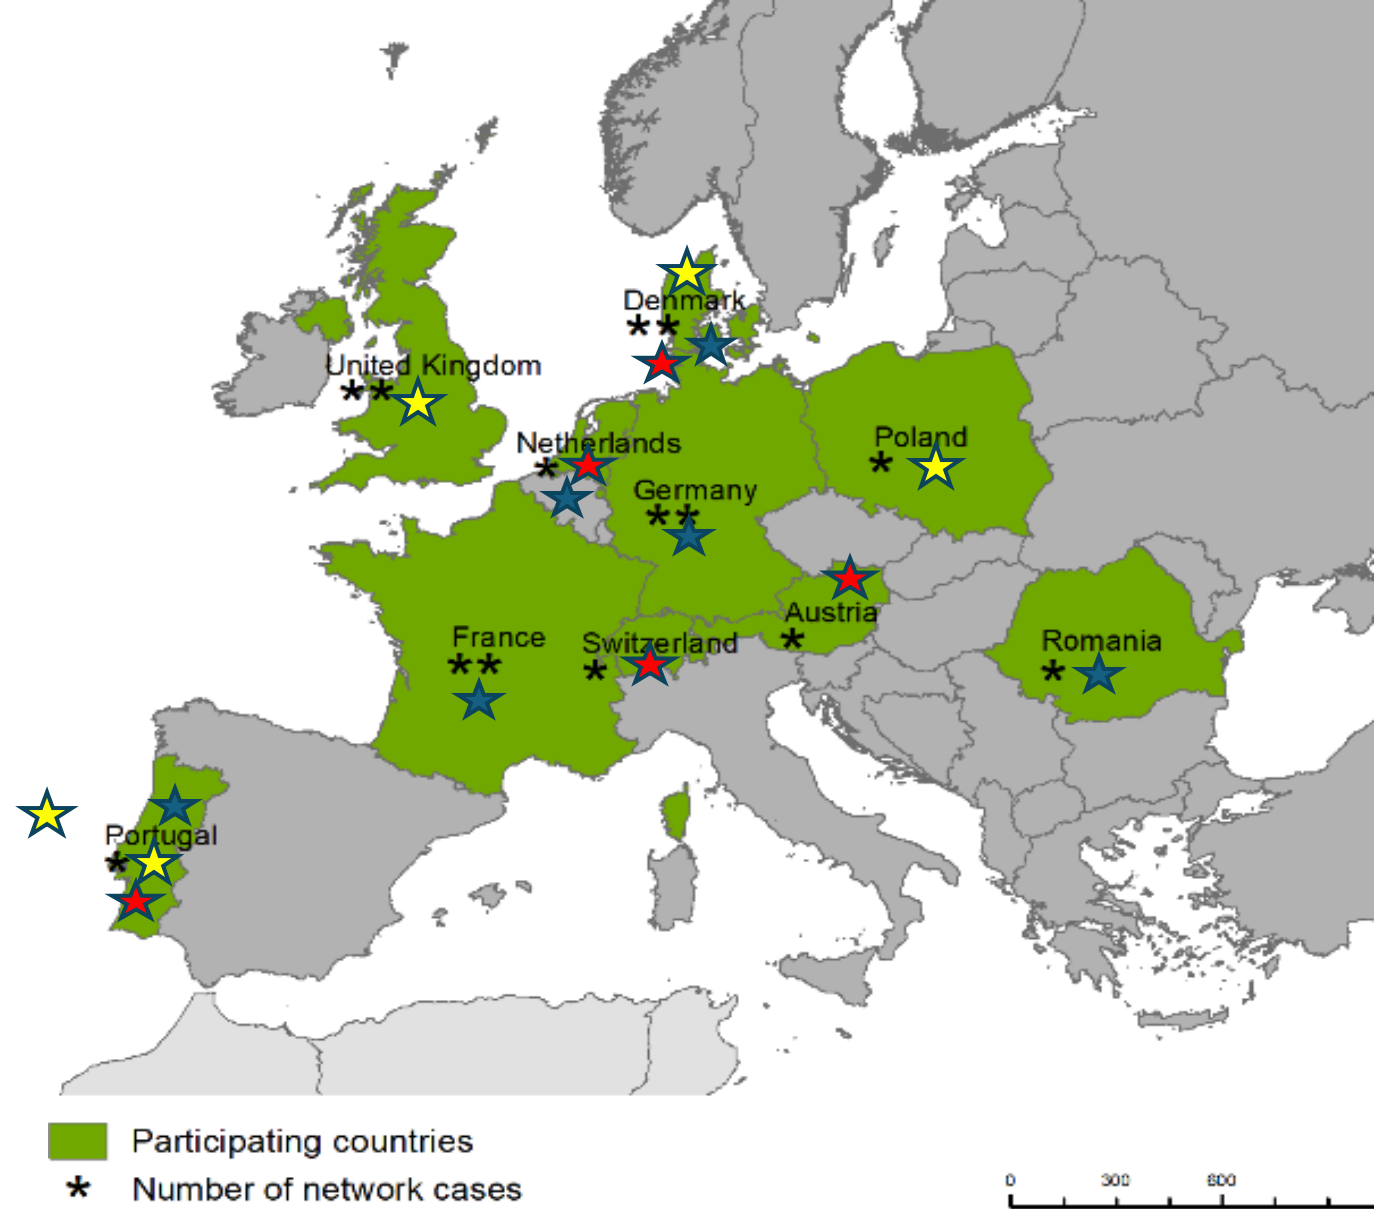

- **Co-creation of knowledge and innovations for transition to MiFAS**
- **Development and assessments of benefits and trade-offs of MiFAS**
- **Decision support for farmers and multiscale assessments for policy support**

Assessment of impacts

Using:

- Existing data sets (national, FADN, EUROSTAT)★
- Data collected from 14 networks ★
- Farm-level innovation case studies
- Landscape level case studies ★
- Value chains case studies ★

Introduction: From Core sites to the Continent

AgroForestry/Mixed Farming (AF/MF) “Core sites”

Long-term sites, 20+ years
With replicates & controls
Bio-physical scientific rigour

Approach:

Measure

1. Agroforestry
2. Forest
3. Grass/Arable

Model scenarios

Upscale to landscape level

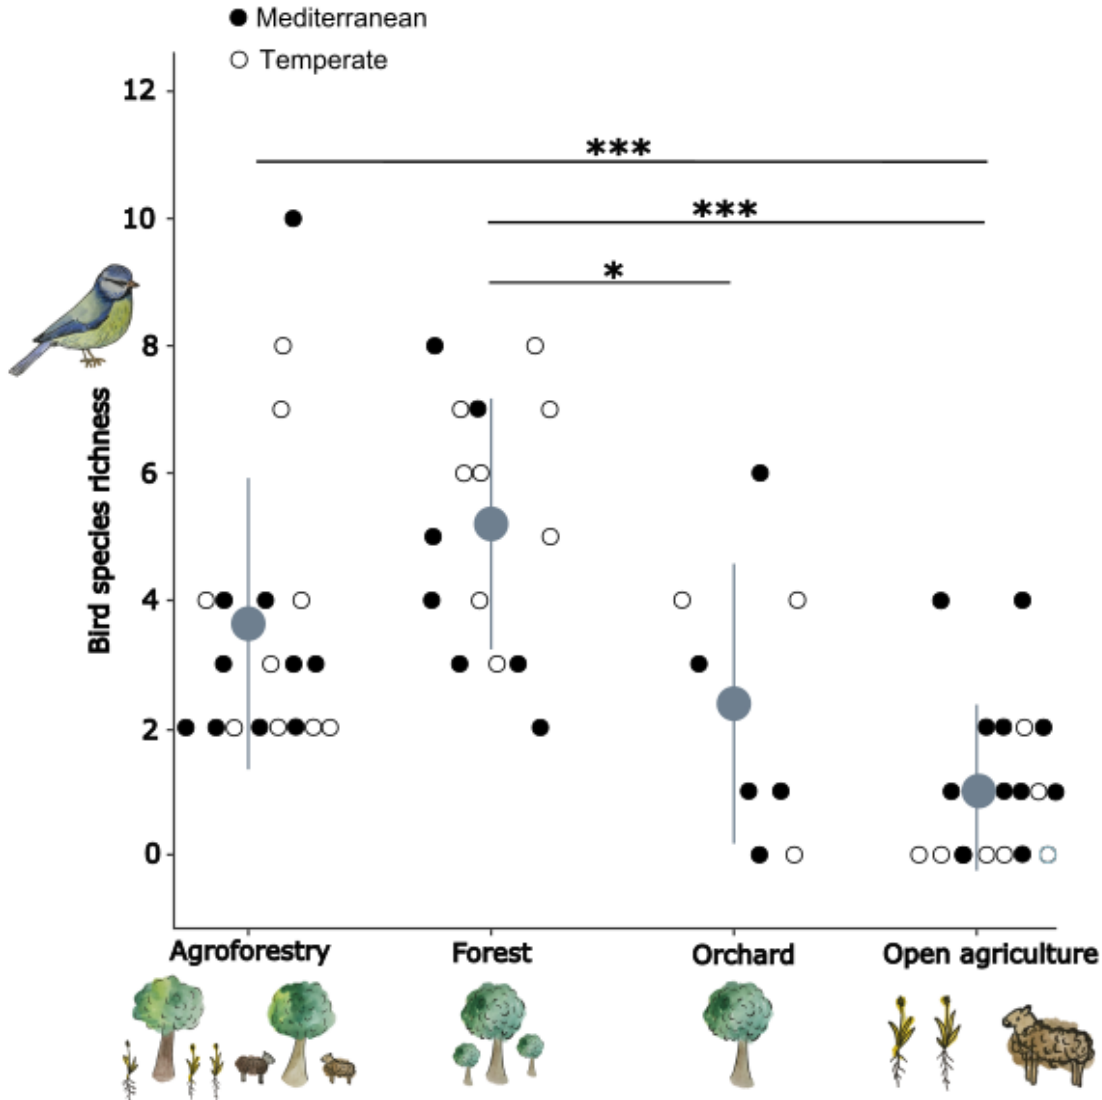

Measure

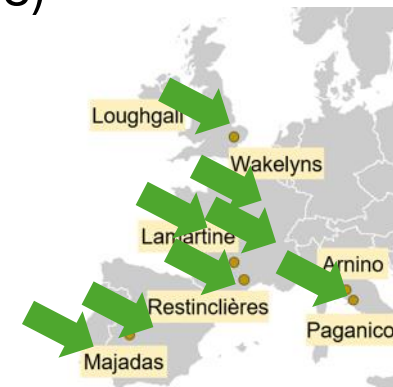

Biodiversity benefits of AF/MF

AF/MF = AgroForestry & Mixed Farming

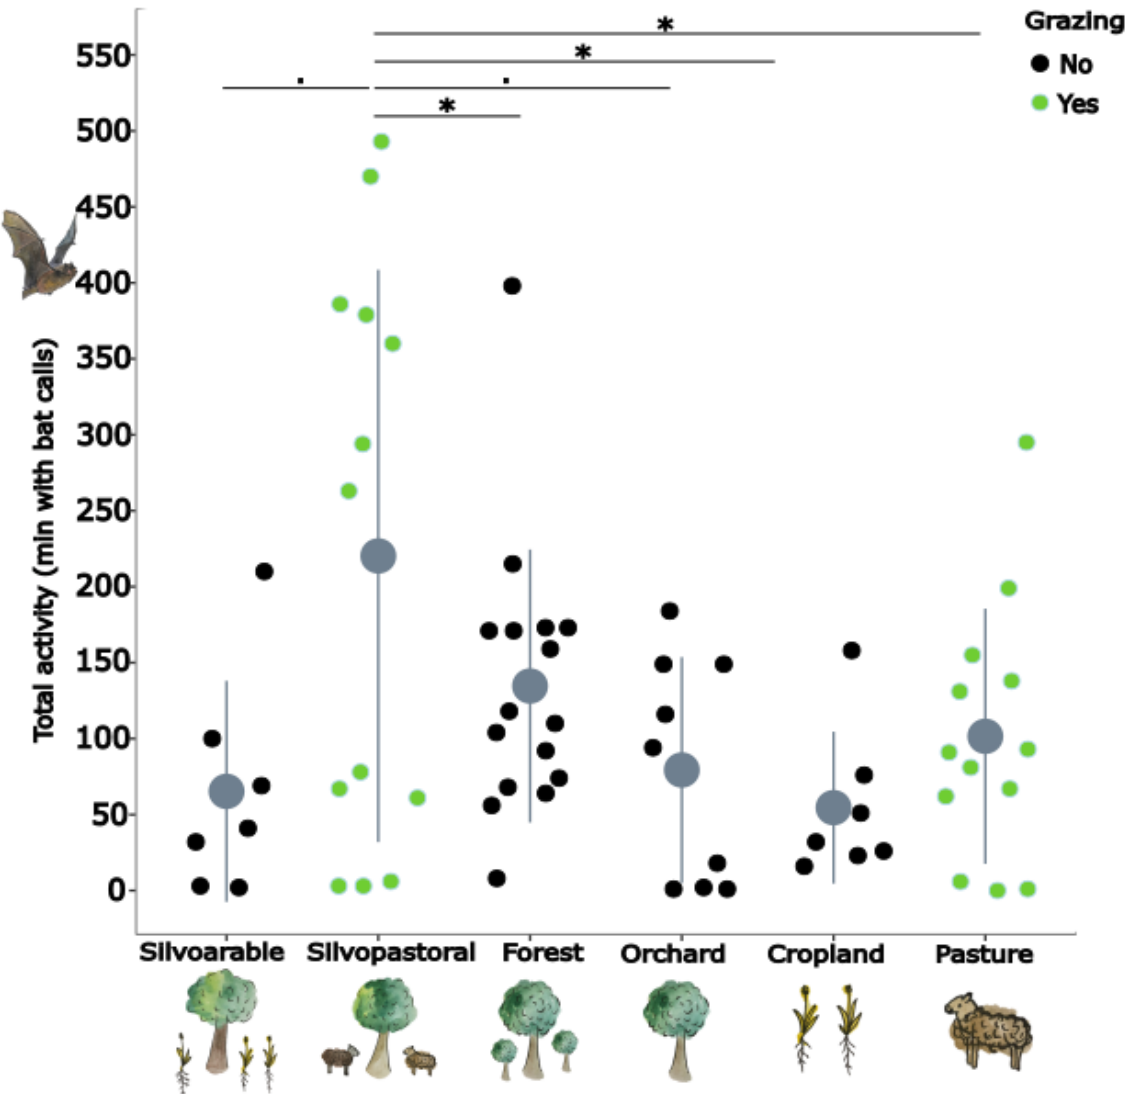

Bird species richness: Agroforestry > Open farmland

- Data analysis from 8 sites
- Number of species: 48
- Number of bird records: 305
- Agroforestry sites (n=19), forests (n=15), orchards (n=8), open agriculture: cropland/pasture (n=18)
- Significant differences for bird species richness (indicator of diversity)

Bat activity: Highest in silvopastoral agroforestry

- Data analysis from 8 sites
- Number of species/species groups: 10
- Silvoarable (n=7), silvopastoral (n=13), forests (n=16), orchards (n=9), cropland (n=7), pasture (n=13) Echolocation activity (number of active minutes)
- Significant differences in activity
silvopasture higher than forest

Edo et al. (subm.)

—
Can we **measure** climate resilience of AF/MF?

AF/MF = AgroForestry & Mixed Farming

Agroforestry and microclimate conditions

- Loughgall (UK)
 - in summer higher **temperature-humidity index (THI)** in grassland system compared with AF; heat stress threshold exceeded in August only in pasture plots
- Lamartine (FR)
 - in summer: presence of trees increases amplitude of **THI** between day and night, decreases solar radiation and wind speed; heat stress threshold exceeded in July and August only in pasture plots
- Tenuta di Paganico (IT)
 - in silvopastoral system significantly lower black globe index compared to open pasture; heat stress threshold was exceeded from June to August (10-12 hours per day), in July also in AF, but for fewer hours

THI June 21-

THI July 21-

THI August 21-

Loughgall (UK)

- grassland
- agroforestry
- heat stress threshold

Lamartine (FR)

- grassland
- agroforestry (on the hedge)
- agroforestry (60 trees/ha)
- heat stress threshold

Tenuta di Paganico (IT)

- grassland
- silvopastoral
- heat stress threshold

Ripamonti et al. (2023)

Animal productivity and welfare: Open pasture in spring, agroforestry in summer

Daily weight gain

Cortison stress levels

In Italy and France (Lamartine) core sites, the heat stress during the summer period resulted in **significant differences in hair cortisol concentration** (an index for heat stress monitoring).
The heat stress affected **live weight gain** and **eating behaviour**.

Model

Can we **model** climate resilience of AF/MF?

Different Scenarios
RCP
Representative
Concentration
Pathways of
 CO_{2eq} (carbon and
 carbon-equivalent
 emissions)
 RCPs are labelled the
 radiative forcing values
 in the year 2100 (2.6,
4.5, 6, and **8.5** W m⁻²)

We are on the
 pathway of RCP
 8.5

crop rotation: 6 year
crop-ley-lentil rotation

Tosh, C., Gosme, M., Lecompte, I., Dupraz, C.,
Eden, J., Gossell, C., Simonson, W. (in prep.)

Hi-sAFe RCP8.5: Walnut & wheat complementary phenology, trees protect wheat yield when climate change increases

- **Wheat yield is higher in monoculture** in the first half of the century when trees are smaller and climate change is less pronounced
- Beyond **2068 agroforestry consistently boosts yield relative to monoculture**. This is when trees are larger and climate change is more pronounced
- Agroforestry also appears to protect against “**complete disaster**” in years of exceptionally low yield (2044)
- There is **no significant difference in year-to-year variability** of yield between monoculture and agroforestry
- Walnut has a **late budburst** (May). Crops undergo most of their growth in high light intensity and shading is experienced only in the late stages of growth when heat/drought are most intense

Hi-sAFe RCP8.5: Agroforestry increases pea yield already now and increasingly so

- Pea yield is predicted to be improved by agroforestry already now and even more by 2100
- This benefit of AF, with a few exceptions, increases as trees grow larger and climate change becomes more pronounced

Majadas de Tiétar site Spain. Dehesa system

Open-oak woodland “dehesa” ecosystem, tree density 40 tree ha⁻¹, extensive livestock rearing at low intensity (0.3 LU)

AF tree densities and open pastures simulated

1990 → 2090

Pasture Production (mean ± 95 % CI)

Pasture Production Stability (mean ± 95 % CI)

Tree Biomass Increment (mean ± 95 % CI)

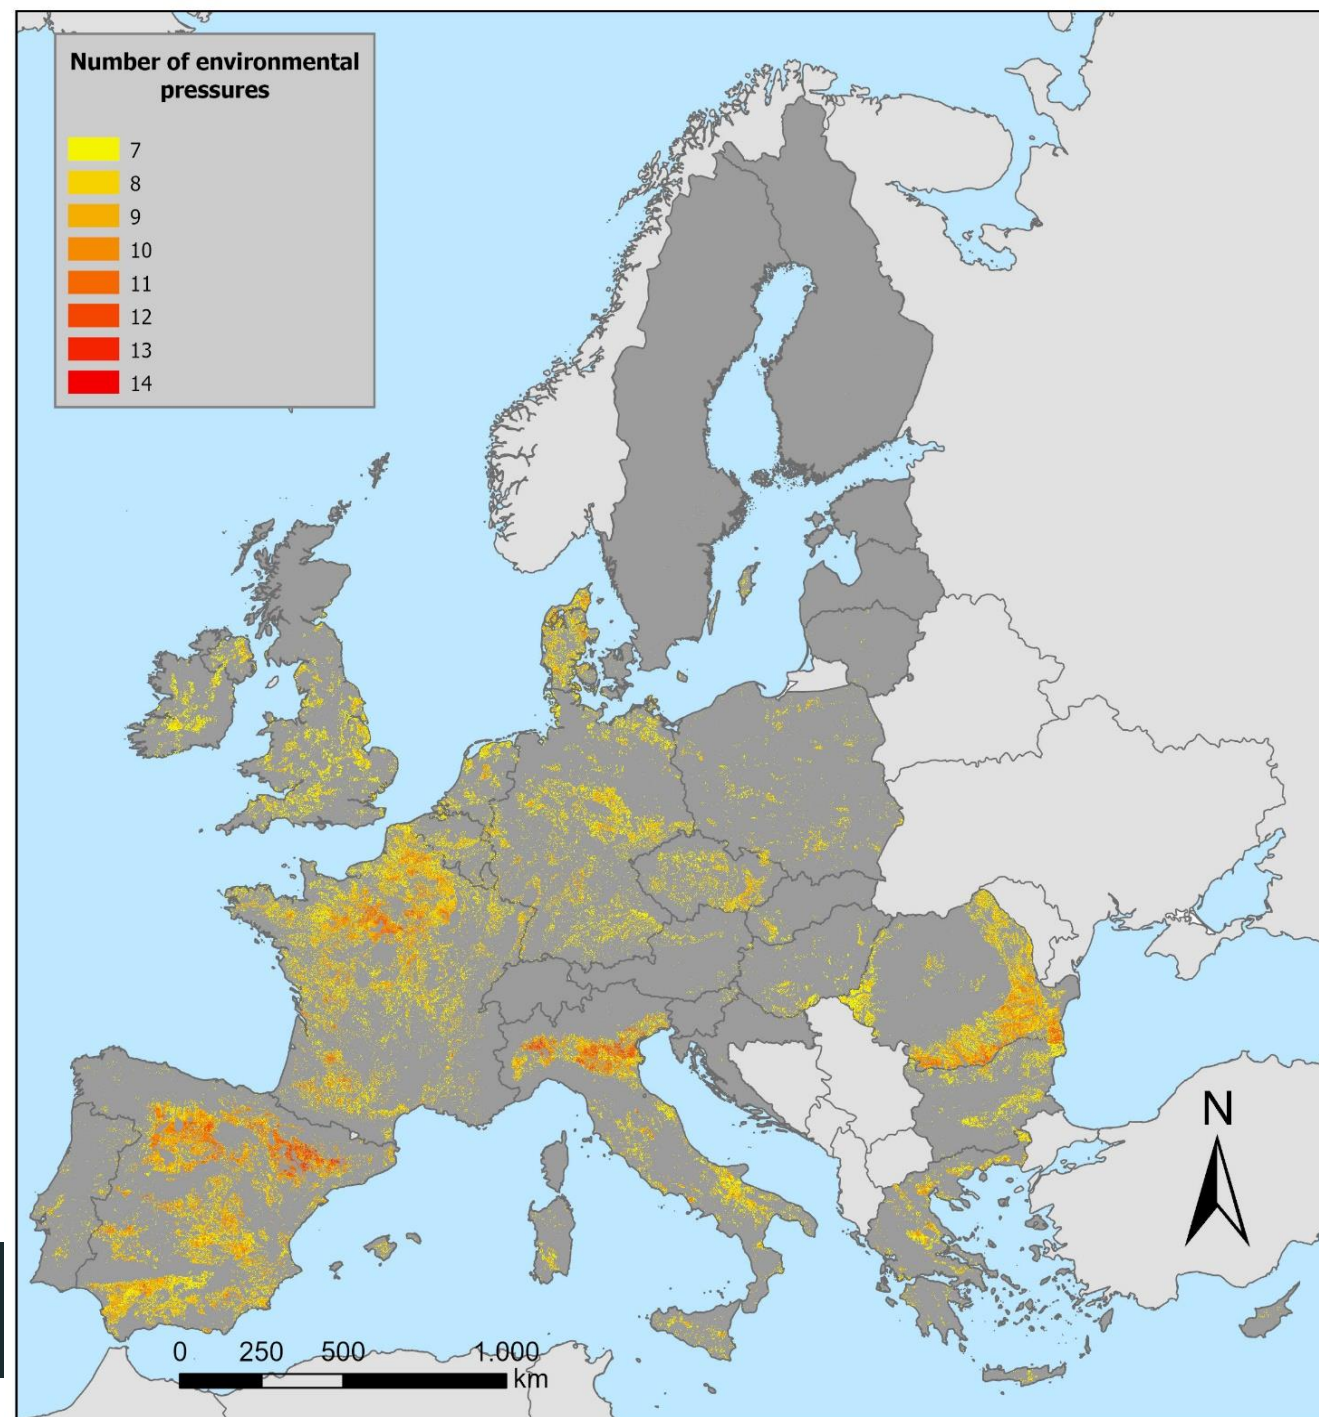

Upscale

—
Can we **upscale** climate
resilience effects of AF/MF?

Where to promote AF/MF?

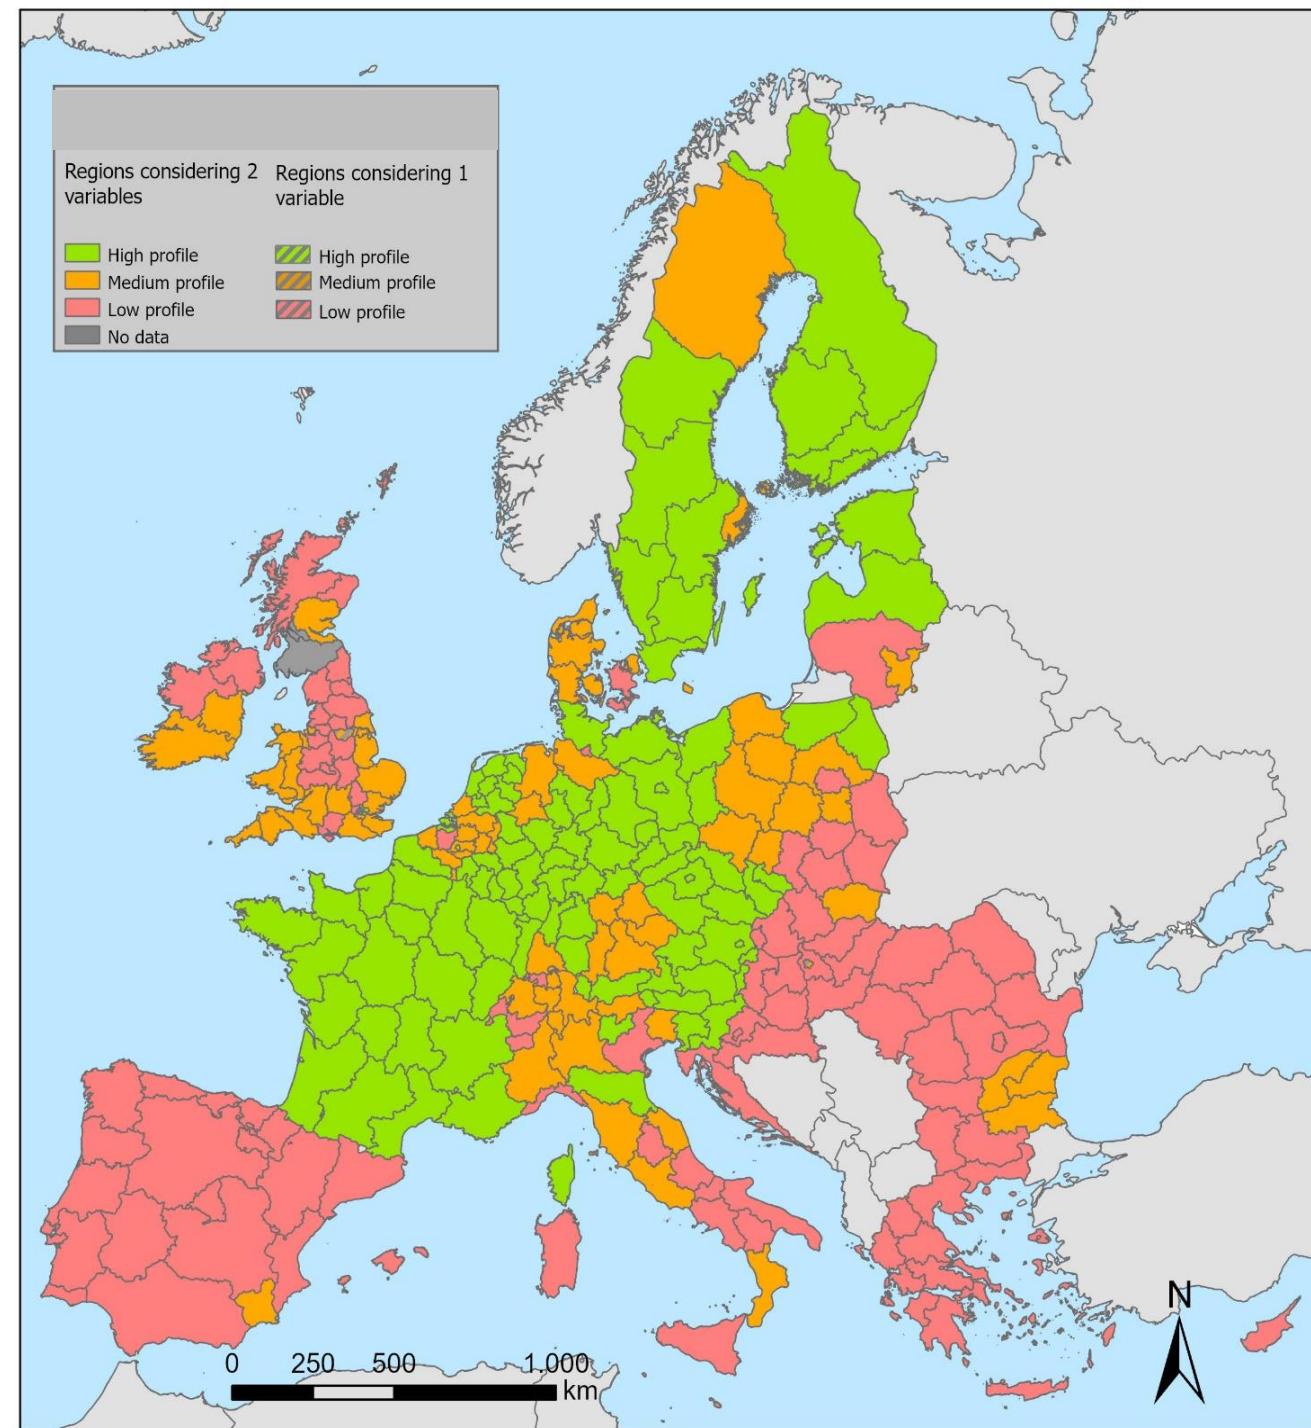

- Regions with accumulated Environmental Pressures (e.g. soil degradation, pollination deficit, high CC impact, etc.)
- If AF were introduced on 10% of «Pressure areas», up to 43% of European agricultural GHG emissions could be compensated

Schnabel et al *in prep*
Kay et al. 2019 *Land Use Policy*

Where to promote AF/MF?

- «High profile» regions: Well trained farmers and high share of organic farming
- Farmers may be more receptive and capable for adopting AF/MF innovations

LUCIM - Land Use Change Interactive Map

Driving the transition towards more resilient and efficient land use in Europe

Introduction | Who is this tool for? | **European target areas for agroforestry and integrated crop/livestock systems** | Land use change models for increased resilience to climate change | The AGROMIX project

[Go straight to the maps](#) [Go straight to the tool](#)

Under construction
Spatially explicit, includes expert evaluations for climate resilience

In the face of future climate challenges, it is of the utmost importance to drive the transition towards more resilient and efficient land use in Europe. Agroecological approaches such as agroforestry and integrated crop and livestock systems (also called mixed farming) have been recognized as "highly efficient adaptation options that enhance resilience to climate change" (IPCC, 2022). But can we target the areas where such systems should be established? What kind of systems should be established according to a farm's environment, and what are the particular characteristics or mechanisms of these agroecological systems that enhance their resilience, compared to conventional systems?

The **LUCIM - Land Use Change Interactive Map** - tries to bring these two components together. The first part explores a spatial approach to identify target areas in Europe where resilient and climate-smart agroforestry and mixed farming systems should be a priority for introduction, considering existing environmental pressures and socio-economic contexts. The second part establishes a guided cascade of context settings and suggests future scenarios of land use, where different models of land use change can be evaluated as pathways towards increased resilience.

European target regions for Agroforestry and mixed systems

Land use change models for increased resilience to climate change

Interactive maps that explore environmental and climate change pressures across Europe to identify target areas for agroforestry and mixed systems, while also considering the socio-economic context in which the transition of land use needs to occur.

Step by step guide through a land use change journey to increase resilience to climate change, by transitioning from a baseline agricultural or forestry system towards more agroecological land use models.

What are the target regions for agroforestry and integrated crop/livestock systems?

Which pathway of land-use change to take?

[Back to homepage](#)

European target areas for Agroforestry and Mixed systems

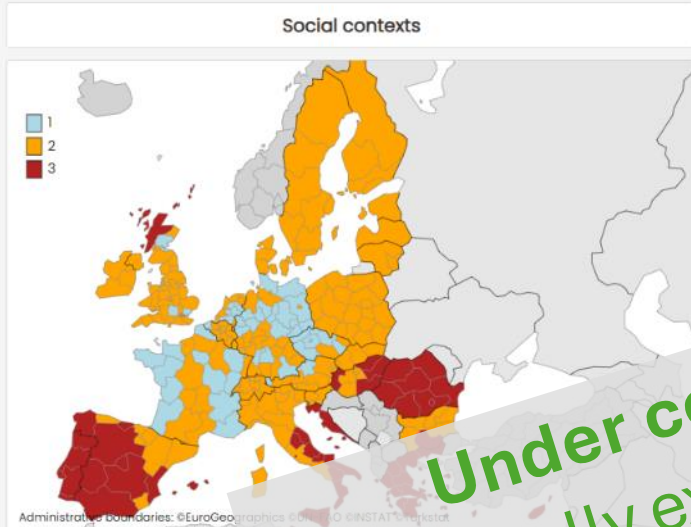

Target areas

Target areas

Environmental pressures

- All environmental pressures
- Soil-related pressures
- Biodiversity-related pressures
- Water-related pressures
- Climate change-related pressures

Socio-economic contexts 1, 2 and 3 in the EU27, UK and CH.

Socio-economic factors

Social contexts

Economic variables

- Mean economic size of farms (euros)
- Unemployment rates (%)

Demographic variables

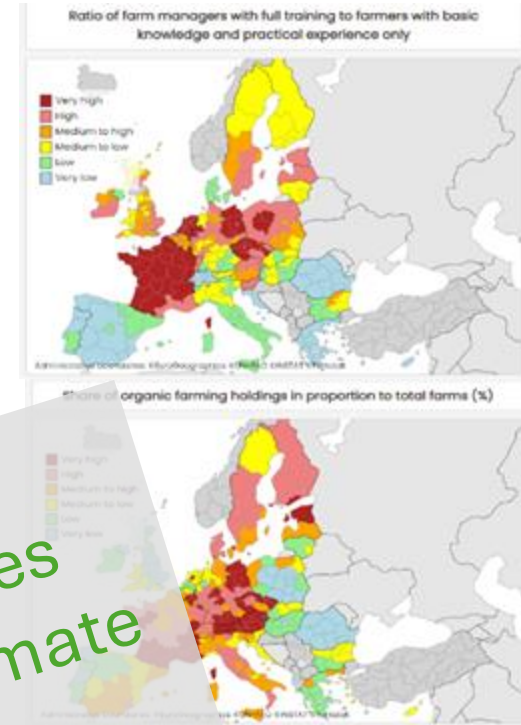

- Ratio of young farm managers (< 40 y.o) to elderly farm managers (> 65 y.o.)
- Degree of urbanisation

Under construction
Spatially explicit, includes expert evaluations for climate resilience

Context number 1 captures regions with a confluence of positive characteristics, therefore categorized as a "high profile" context. These regions are characterized by a higher prevalence of organic farming, a well-educated and younger farm management population, larger farms in terms of economic size, lower unemployment rates, and a predominantly urban character. These combined factors suggest a strong economic base, a modern and potentially more productive agricultural sector, and a favorable demographic profile.

Context number 3 encompasses regions facing several challenges, so it was categorized as "low profile". These regions tend to have lower adoption of organic farming practices, a less educated and likely older farmer population, smaller farms in terms of economic size, higher unemployment rates, and a predominantly rural character. This combination suggests a potentially weaker economic base, a less modern agricultural sector, and a demographic profile that might face challenges in attracting young talent.

Context number 2 encompasses all regions not accounted for in contexts 1 and 3. While it serves as an intermediary between the two, it also encompasses unique combinations of attributes not present in either extreme. Notably, regions are classified into context 1 or 3 based on meeting a minimum of four (up to six) specified socioeconomic factors outlined in Table 23. Regions failing to meet this criterion for either context are categorized as context 2 regions.

Development of guidelines for
land management to promote
AF/MF systems

Agroforestry systems in the LULUCF inventory and guidelines for land management

Agroforestry is not included in the LULUCF inventory; little information regarding emissions and removals
→ AGROMIX is creating a model and maps using long-term experimental sites:

- Mapping spatially agroforestry patterns using remote sensing (Sentinel images, LUCAS database), machine learning, data mining
- Final results allow defining and detecting agroforestry systems for inclusion in the LULUCF inventory (research ongoing).
- include [agroforestry systems in the Greenhouse Inventories of European countries](#).

LULUCF: Land Use, Land Use Change and Forestry

Conclusions bio-physical evidence of ‘agromixed’ systems

- 1) Agroforestry **significantly increases biodiversity** (birds, bats as proxies for above ground diversity).
It can be as good as forest and outperforms monoculture.
- 2) Agroforestry (silvo-pasture) **significantly improve micro-climate and animal welfare** (heat stress) and subsequently animal production.
- 3) Agroforestry systems (silvo-arable) and mixed farming can **stabilise crop yields** under climate change.
- 4) Wheat yield is predicted higher in monoculture in the first half of the century when climate changes is less pronounced, beyond 2068 agroforestry is predicted **higher yields relative to monoculture**
- 5) Agroforestry systems are **not an extensification measure**; they maintain productivity, increase animal welfare and diversity significantly, while adding further environmental services, not all fully understood or comprehensively addressed in this research (soil fauna, long term flooding)
- 6) **Tree density**: even 50 trees/ha can be “enough” to get effects in LER (e.g. LER 1.27 for barley in Ireland)

Socio-Economic and Policy relevance of 'agromixed' systems

- 1) **Significant biodiversity** benefits (above and below ground) are an ecosystem service and public good
- 2) **Significant animal welfare benefits** are a public good, could be mandatory as heat stress could be illegal animal cruelty
- 3) **Carbon sequestration** contribution is an ecosystem service (LULUCF)
- 4) **Climate Extinction**: agroforestry as modelled could provide **some protection** from RCP4.5 and RCP8.5 (worse case, but increasingly likely climate scenarios)
- 5) **Productivity: LER Land Equivalent Ratio is higher, at least 1.2**, also from 2050 onwards under RCP8.5. This increases overall productivity but also requires **innovation management for agroforestry supply chain products** in a bio-economy.
- 6) Importance of **long-term (100 years) ROI (return on investment)** including social and ecosystem benefits. As modelled, trees initially cost money with little benefit, but over 100 years their higher ROI makes a case for public funding during the establishment phase (like free school, free advice and trees).

Sheep used to graze pine forest understories in Catalunya to reduce the risk and intensity of fires.

Groundwater recharge

Wildfire control

Weed and pest control

Soil carbon increase

Less nutrient leaching

High Land Equivalency Ratios

Higher above & below ground biodiversity

Mitigation

Adaptation

Higher, stabler incomes

Nutrient cycling

Erosion control

Extreme weather buffering

Nutrition

POLICY SUMMIT 2024

Definitions of Agroforestry and Forestry

1

| Tree Location | AF System | Land Use Classification (e.g. LPIS) | |
|-----------------------|---------------------|--|---|
| | | Forest Land | Agricultural Land |
| Trees within parcels | Silvopastoral | Forest Grazing | Wood pasture Orchard grazing |
| | Silvoarable | Forest Farming | Alley Cropping Alley Coppice Orchard Intercropping |
| | Agrosilvopastoral | Sequential mixtures of silvoarable and silvopastoral systems | |
| Trees between parcels | Linear Agroforestry | Forest Strips | Shelterbelt Networks Wooded Hedges Riparian Tree Strips |

The EU had a simple agroforestry definition in CAP 2017/22

“Land use systems in which trees are grown in combination with agriculture on the same land (Reg 1305/2013)”.

Agroforestry trees can be inside parcels or on boundaries (e.g. hedges).

Agroforestry can be on forest parcels (e.g. “forest grazing”) or agricultural parcels (e.g. “wood pasture”)

Definitions of AF in CAP Strategic Plans

- All Member States define “agroforestry” in their **CAP Strategic Plans**.
- Most give the **maximum numbers of trees per hectare** (e.g. 400/ha), but few give the minimum number or the definition of “tree”.
- Few of the definitions can be used easily in **remote sensing**.
- **All Member States have defined woody-landscape-features** (individual trees, hedges and trees in groups and lines) in their Strategic Plans IACS/LPIS systems
- Member States have to report the area of **new agroforestry** (Result Indicator 17.3) and woody landscape-features (Result Indicator 17.4) but this data is not available yet.
- **Landscape-feature** areas are recorded as **Impact Indicator 21**, but this is only available at a very high level based on LUCAS sampling. MS are encouraged in the NRR to develop their own metrics.
- **The target of 10% High Diversity Landscape Features in the Nature Restoration Regulation was removed by the EU Parliament, leaving only a commitment to an “increasing trend in HDLF”**
- Several countries (e.g. Ireland, Denmark, Austria) are moving towards better identification and accounting of **LULUCF-GHG emissions from trees** on grassland and cropland.
- **Several Member states have defined “permanent grassland” to include areas which are predominantly covered by shrubs which can be grazed or cut for fodder - and these can be considered as agroforestry**

Art 6 of the LULUCF Regulation v the FMR

Article 4(3) of the CAP Strategic Plan Regulation (2021/2115): *Agricultural area shall be determined in such a way as to comprise arable land, permanent crops and permanent grassland, including when they form agroforestry systems on that area.* The terms ‘arable land’, ‘permanent crops’ and ‘permanent grassland’ shall be further specified by Member States within their CAP Strategic Plans. ([Policy Briefing #22](#))

Article 6 (3) of the LULUCF Regulation (2018/841) defined **Forest Land** according to the Thresholds in Annex II (opposite). These are also used in national forest laws, UNFCCC Marrakesh Accords, REDD+, Kyoto Clean Development Mechanism etc. ([Policy Briefing #8](#))

Therefore, the EU Forest Monitoring Regulation should **use the UNFCCC and LULUCF forest thresholds and not emulate Procrustes.** ([Policy Briefing #15](#))

One Size Fits ALL ??

Procrustes was a Greek robber who either stretched his victims or cut off their legs to fit his one-size-fits all bed

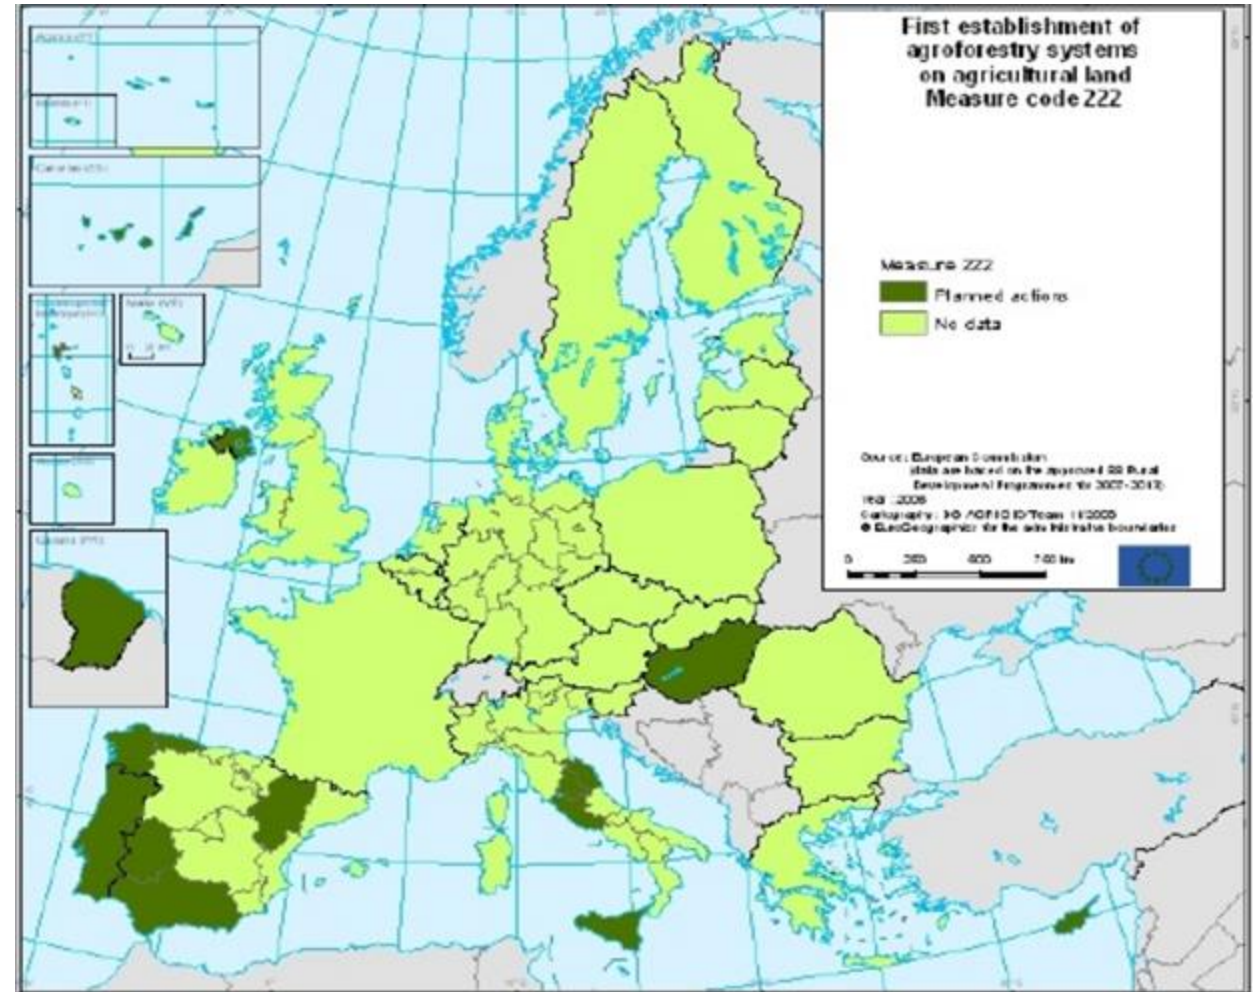

| Member State | Area (ha) | Tree crown cover (%) | Tree height (m) | Minimum width (m) |
|----------------|-----------|----------------------|-----------------|-------------------|
| Malta | 1,0 | 30 | 5 | |
| Spain | 1,0 | 20 | 3 | 25 |
| Portugal | 1,0 | 10 | 5 | 20 |

| Austria | 0,05 | 30 | 2 | 10 |
| Czech Republic | 0,05 | 30 | 2 | 20 |

Support for Agroforestry in previous CAP Periods

EU Agroforestry Policy: CAP 2007-2013

- Agroforestry was mentioned 6 times in the first EU Forest Strategy (1999)
- Regulation 1698/2005 included support for **afforestation** of agricultural land and was adopted in **66 regions** (from 88)
- However support for **new areas of agroforestry** were adopted only in **18 regions** (CY, ES(6), FR(2), HU, IT(5), PT(2), UK(1)),
- More than 3000 beneficiaries were planned on 60 000 ha
- France (Hexagone) and Flanders - implemented agroforestry in 2010.
- A wide range of other measures were used in a modest way to support small-scale tree planting on farms (see [Mosquera et al 2016](#))

In the end, the agroforestry measure was made available to farmers in only 5 regions

Agroforestry in the CAP 2015-2022 (Measure 8.2)

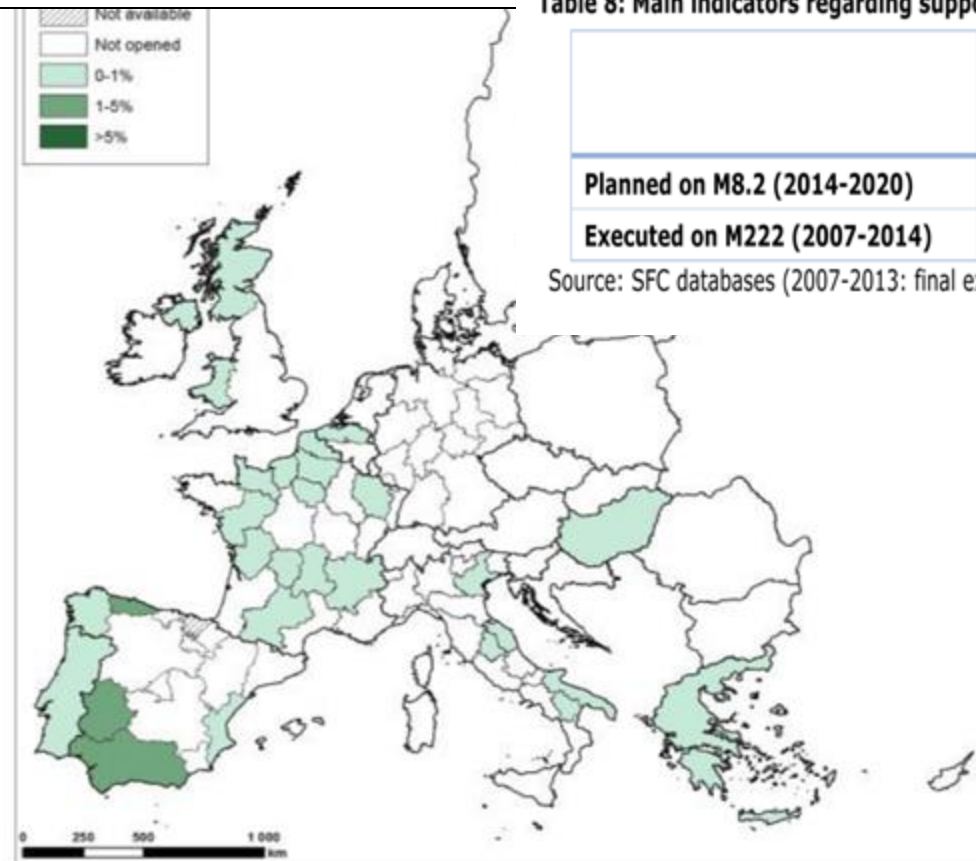

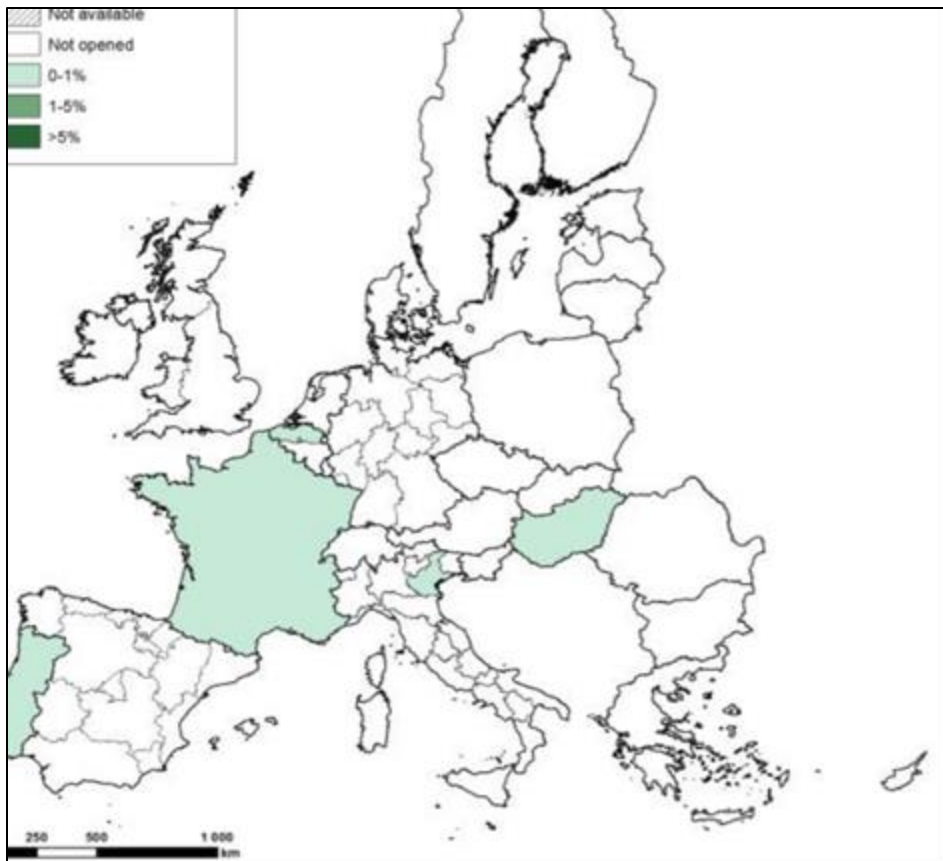

Table 8: Main indicators regarding support to the establishment agroforestry systems

| | Area established in agro-forestry systems | Public expenditure |
|-------------------------------------|---|--------------------|
| Planned on M8.2 (2014-2020) | 72 529 ha | 123,3 M€ |
| Executed on M222 (2007-2014) | 2 904 ha | 2,1 M€ |

Source: SFC databases (2007-2013: final expenditure; 2014-2020: extraction January 2017)

Source: SFC databases (2007-2013: final expenditure; 2014-2020: extraction January 2017)

Missed opportunity - agroforestry in the CAP

A 2007-14 CAP.

C AF Planned in 19 RDPs with expenditure of 14.6M€ and 28 k ha

D Abandoned in 8 RDPs, Only 275 beneficiaries and 2,904 ha

G Expenditure was 6% of planned

2014-2021 +2 CAP **B**

AF Planned in 35 RDPs, expenditure of 139M€ and 84 k hectares **E**

By 2019 abandoned in 1MS and 5RDPs and 2,136ha planted **F**

Planned expenditure by 2019 down to 64M€ and only 3.3 M€ (2.5% of planned) spent **H**

MS tend to underspend forestry and agroforestry budgets. 600 kha of afforestation was planned in 2015 for the current CAP, but MS reduced this 250 kha at the end of 2019, and planted only 70 kha. Targets and achievement are shrinking.

Pillar I - Conditionality

In order to receive EU income support, farmers must respect a set of basic rules. **The interplay between this respect for rules and the support provided to farmers is called conditionality.**

Rules farmers are expected to comply with include:

- **statutory management requirements (SMRs)**, these apply to all farmers whether or not they receive support under the common agricultural policy (CAP);
- **good agricultural and environmental conditions (GAECs)**, these apply only to farmers receiving support under the CAP.

Good Agricultural and Environmental Conditions

Climate change

- **GAEC 1:** Maintenance of **permanent grassland** based on a ratio PG/agricultural area (at national, regional, sub-regional, holding level) (“greening”)
- **GAEC 2:** Protection of **wetland and peatland** (new)
- **GAEC 3:** **Ban on burning** arable stubble, except for plant health reasons (cross-compliance)

Water

- **GAEC 4:** Establishment of **buffer strips** along water courses stubble [minimum width of 3 meters] (cross-compliance)

Soil

- **GAEC 5:** **Tillage management** reducing soil erosion risk with slope consideration (cross-compliance)
- **GAEC 6:** **Minimum soil cover** to avoid bare soil in **periods that are most sensitive** (cross-compliance)
- **GAEC 7:** **Crop rotation** in arable land, except for crops growing under water (“greening”)

Biodiversity and landscapes

- **GAEC 8:** **Minimum share of agricultural area [arable land] devoted to non-productive areas or features**, retention LF, ban cutting hedges/trees during bird rearing season
- **GAEC 9:** **Ban on converting or ploughing permanent grassland designated as environmentally-sensitive** in Natura 2000 sites (“greening”)

“Simplification”

For GAEC-8 “[farmers] ... may choose to keep a share of their arable land non-productive - or establish new landscape features (such as hedges or trees) - and thereby receive additional financial support via an eco-scheme that all Member States will have to offer in their CAP Strategic Plans. All EU farmers will be incentivised to maintain non-productive areas beneficial for biodiversity without fearing loss of income”.

Tree-Landscape-Features are vital for climate and biodiversity ...

Woody features: hedgerow or woody strips, trees in groups isolated trees, trees in line, forest edges

Other features: buffer strips, cairns, cultural features, ditches, field margins, small ponds, small wetlands, stone walls, terraces, others ... countries make their own choices ...

Consistency in tracking Landscape Features in MS is needed .. but some MS don't include

| RED shows where the definition of "copse/grove" on agricultural land differs from the national definition the minimum size threshold for a forest block. In many countries the size threshold is not given or copses/groves are not recognised as Landscape Features | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| In many countries no information is given on the types of n-fixing crop or catch/cover crop, even when the 7% option is selected (shown with a dash) | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Landscape features should be linked to farmers fields using IACS/LPIS systems - not LUCAS

Four overlapping layers:

1. Reference Parcels
2. Agricultural Parcels
3. Ecological Focus Areas
4. Landscape Features

Use LPsi for statutory designations like Nitrate Sensitive Zones Pillar II Grants & LULUCF Reporting

Landscape features (location, type)

- Hedgerow
- Group of trees
- Isolated trees
- Pond
- Ancient monument
- ...

Land use / land cover

- Arable land
- pasture
- Forest
- Permanent crop
- ...

Eligibility of land

100% eligible

Pillar I - Ecoschemes (Article 31)

Agricultural practices that could be supported by eco-schemes have to meet the following conditions:

- they should cover activities related to **climate, environment, animal welfare and antimicrobial resistance**;
- they shall be defined on the basis of the needs and priorities identified at **national/regional levels**;
- their level of ambition has to go beyond the requirements and **obligations established under the baseline** (including conditionality);
- they shall contribute to reaching the **EU Green Deal targets**.

Huge number of potential Ecoschemes (1)

Agro-ecology

- Crop rotation with leguminous crops
- Mixed cropping - multi cropping
- Cover crop between tree rows on permanent crops - orchards, vineyards, olive trees - above conditionality
- Winter soil cover and catch crops above conditionality
- Low intensity grass-based livestock system
- Use of crops/plant varieties more resilient to climate change
- Mixed species/diverse sward of permanent grassland for biodiversity purpose (pollination, birds, game feedstocks)
- Improved rice cultivation to decrease methane emissions (e.g. alternate wet and dry techniques)

Husbandry and animal welfare plans

- Feeding plans: suitability of and access to feed and water, feed and water quality analyses (e.g. micotoxines), optimised feed strategies
- Friendly housing conditions: increased space allowances per animal, improved flooring (e.g., straw bedding provided on a daily basis), free farrowing, provision of enriched environment (e.g. rooting for pigs, perching, nest-building materials, etc.), shading/sprinklers/ventilation to cope with heat stress
- Practices increasing animal robustness, fertility, longevity and adaptability, e.g. lifespan of dairy cows; breeding lower emission animals, promoting genetic diversity and resilience
- Animal health prevention and control plans: overall plan for reducing the risk of infections that require antimicrobials and covering all relevant husbandry practices, e.g. crawl space between two rearing belts, vaccination and treatments, enhanced biosecurity, use of feed additives, etc.
- Providing access to pastures and increasing grazing period for grazing animals
- Provide and manage regular access to open air areas

Agro-forestry

- Establishment and maintenance of landscape features above conditionality
- Management and cutting plan of landscape features
- Establishment and maintenance of high-biodiversity silvo-pastoral systems

Note that Landscape features are clearly judged as agroforestry

And more potential ecoschemes (2)

High nature value (HNV) farming

- Land lying fallow with species composition for biodiversity purpose (pollination, birds, game feedstocks, etc).
- **Shepherding on open spaces and between permanent crops, transhumance and common grazing**
- **Semi-natural habitat creation and enhancement**
- **Reduction of fertiliser use, low intensity management in arable crops**

Carbon farming

- **Conservation agriculture**
- Rewetting wetlands/peatlands, paludiculture
- Minimum water table level during winter
- Appropriate management of residues, i.e. burying of agricultural residues, seeding on residues
- **Establishment and maintenance of permanent grassland**
- **Extensive use of permanent grassland**

Precision farming

- **Nutrients management plan, use of innovative approaches to minimise nutrient release, optimal pH for nutrient uptake, circular agriculture**
- Precision crop farming to reduce inputs (fertilisers, water, plant protection products)
- Improving irrigation efficiency

Improve nutrient management

- **Implementation of nitrates-related measures that go beyond the conditionality obligations**
- **Measures to reduce and prevent water, air and soil pollution from excess nutrients such as soil sampling if not already obligatory, creation of nutrient traps**

Protecting water resources

- **Managing crop water demand (switching to less water intensive crops, changing planting dates, optimised irrigation schedules)**

Other practices beneficial for soil

- **Erosion prevention strips and wind breaks**
- **Establishment or maintenance of terraces and strip cropping**

Other practices related to GHG emissions

- **Feed additives to decrease emissions from enteric fermentation**
- **Improved manure management and storage**

Pillar II - Investment Measures (Article 73)

Paragraph 4... maximum rate may be increased to ... (c) 100% for the following investments (1) afforestation, **establishment and regeneration of agro-forestry systems**, land consolidation in forestry and nonproductive investments linked to one or more of the specific objectives set out in Article 6(1), points (d), (e) and (f), including non-productive investments aimed at protecting livestock and crops against damage caused by wild animals;

Pillar II - Agri-Environment - Climate (AEEM) (Article 70)

- Actions go beyond SMR and GAEC standards
- Commitments for 5-7 years (but may be longer or shorter - if a case is made in the CSP)
- Annual payment per hectare or a lump sum
- Payments “basis of the additional costs incurred and income foregone resulting from the commitments made, taking into account the targets set”.
- Can take into account “transaction costs”

CAP Agroforestry Support Measures (2023-2028)

| MS | Article | Code | O.16 (total) | R.17 (total) | Measure |
|-------|-----------|------------|--------------|--------------|--|
| BE-FL | Art 70 | 3.7 | €281,384 | | Management of agroforestry systems (boslandbouwsystemen) |
| CZ | Art 70 | 26.7 | €1,357,200 | | Caring for an established agroforestry system |

| SK | Art 73-74 | 73.01 | | €2,932,150 | Establishing an agroforestry system |

ONLY 17 AF measures from a total of 948 in Articles 31 (ECO), 70 (AECM) and 73-74 (INVEST)

Other CAP Measures

Article 71 - natural or other area specific constraints

Article 72 - Area specific disadvantages from mandatory requirements

Article 76 - Risk management tools

Article 77 - Cooperation (e.g. EIP, Leader)

Article 78 - Knowledge exchange and dissemination

—
Sustaining support - CRCF,
SFI, Agri-ETS, GreenData4All,
LULUCF

The -310 MtCO₂e EU target is **very unlikely to be reached by 2030... or beyond**

AFOLU

IPCC recommend a single integrated Agriculture, Forestry and Other Land Use (AFOLU) pillar to replace LULUCF as far back as 2006 to.....

“resolve inconsistencies and avoid double counting... removing the arbitrary distinction between the agriculture and LULUCF categories, and promoting consistent use of data and more reliable treatment of land conversions”.

AFOLU is Better!!

In Spain NDVI (to distinguish bare ground), DTMs (to eliminate steep slopes) and LIDAR (to distinguish tree from shrub cover) are used to establish eligibility for Direct Payments. The “SIGPAC Visor” is fully public.

SIGPAC: Coefficient of Eligibility for Direct Payments

Sharing information between projects ...

Staff from 8 projects cooperated
on the Spanish Policy Briefing

Summary

- We present an analysis of the inclusion of agroforestry systems (agroforestry) in the Spanish CAP Strategic Plan 2023-27 (CSP), and other related national and regional plans and regulations. The CSP establishes a **maximum of 100 trees/ha for agroforestry to remain classified as "arable land" or "permanent crops"**, although autonomous regions have the option to reduce this threshold. In "permanent pasture" agroforestry is defined in a more flexible way, based on remotely-sensed information, including LIDAR, and the calculation of a "coefficient of eligibility" for basic payments.
- **Pillar I of the CAP** (Direct Payments) describes nine **Good Agricultural and Environmental Conditions (GAEC/GAEC)** which should be maintained by farmers and administrations. Three of these are particularly relevant to agroforestry: GAEC-8 (maintaining landscape features), GAEC-1 (preserving ratios of permanent pasture) and GAEC-9 (ban on converting permanent pasture in Natura 2000 sites). Also in Pillar I is the new concept of eco-schemes. From the nine eco-schemes implemented by Spain, there are six that may be relevant to agroforestry - in particular those related to extensive grazing and the maintenance of vegetative cover in permanent crops.
- **Pillar II of the CAP includes various measures favourable to agroforestry.** There are 28 investment-measures or agri-environment-climate measures in Spain, and at least 13 *could* be used for the establishment and maintenance of agroforestry - however only two of these explicitly include agroforestry in their titles. Agroforestry-related measures have been activated in 10 - 11 autonomous regions. All regions have activated at least 4 of the 13 measures, with an average activation per region greater than 7.
- In the **CAP Performance Monitoring and Evaluation Framework**, three indicators are particularly important: R.17, which indicates the area of forestry and agroforestry established by Member States; O.16 which indicates the amount of forestry and agroforestry receiving annual support from Member States and I.21, which indicates the area of landscape-feature supported by member states.
- The **Spanish Land Parcel Identification System (SIGPAC)** is almost unique in Europe, since it comprehensively includes both agricultural and forest parcels, and has two specific land use categories for silvopasture (pastures-with-trees and pastures-with-shrubs), although there is no specific "agroforestry" or "silvoarable" category.
- **Tree-cover-density on Spanish grassland/cropland was calculated** using Copernicus and Coring datasets for 2018. The Zero-Tree-Index (canopy cover <0.05%) was around 70% (11.39 Mha), which is around the average for EU Member States, although there were large regional differences.
- **A SWOT analysis on agroforestry in Spain is presented**, resulting from workshops in which more than 25 actors participated, including farmers and ranchers, civil society representatives, academics and researchers. The overall conclusion was that the Spanish CAP Strategic Plan is a favourable framework for the maintenance and promotion of agroforestry systems, with financing options in both Pillars I and II. It contains the most favourable set of policies towards agroforestry since the establishment of the CAP, although there are great regional differences and uncertainties in the implementation of these.

Agroforestry systems in the Spanish CAP Strategic Plan: analysis and reflection

This document is the product of a Working Group on Spanish Agroforestry Policy, with the support of the European Agroforestry Federation (EURAF) and the DigitAF Project of the Horizon Europe program. It is a living text and will be updated as policies change. We encourage you to leave comments on the Google Doc versions below and to request to join the Working Group [here](#).

The Policy Jungle !! ... Cooperation needed

| Legislation | Ref | Relevance for the Carbon Removals Certification Framework (CRCF) |
|--|-------------------------------|--|
| REGULATIONS | | |
| Governance of the Energy Union and Climate Action | 2018/1999 | Sets common rules for planning, reporting and monitoring of climate and energy targets - through NECP |
| - Effort Sharing Regulation | 2018/842 | Updated in 2023 for higher targets. Includes non-Co2 gas targets for agriculture. No split is given but the 2023 targets are 10% to 50% of 2005 levels |
| - LULUCF Regulation (2018) | 2018/841 | Updated in 2023. Rules for monitoring emissions and removals on agricultural land (only non CO2) and forests and land use change (all gases) |
| - European Climate Regulation | 2021/1119 | Overall framework for climate-neutrality by 2050 and intermediate targets for 2030 (55%) and 2040 (90%) |
| CAP Strategic Plan Regulation | 2021/2115 | Encouragement subsidies in Pillar (ECO), Pillar II (AECM, INVESTt, COOP, AKIS). Conditionality (e.g. GAEC) rules, WTO rule constraints |
| Agricultural Block Exemption Regulation | 2022/2472 | Specific mention of carbon-farming schemes and option for carbon farming "result-based schemes". Often better terms than CAP |
| Deforestation Regulation | 2023/1115 | Uses the FAO definition of forest and expects the rest of the world to use this for cattle, cocoa, coffee, oil palm, rubber, soya and wood; |
| Forest Monitoring Regulation | COM/2023/728 | Uses the FAO definition of forest rather than that in the UNFCCC Marrakesh Accords 2021 or the LULUCF Reg or National Laws |
| Framework to Facilitate Sustainable Investment | 2020/852 | Aims to inform investors on whether an economic activity is environmentally sustainable by setting common EU-wide criteria. The Delegated Acts for Climate (2021/2139) and Environment (2021/2178) are important - as is the EU Taxonomy Navigator |
| Nature Restoration Regulation | COM/2022/304 | Restore at least 20% of the EU's land and sea areas by 2030, and all ecosystems in need of restoration by 2050. Targets for carbon & HDLF. |
| DIRECTIVES | | |
| Nitrates Directive | 91/676/EEC | Longstanding monitoring of nitrate levels in water bodies, designating NVZs (>50mg/nitrates), codes of good agric practice to reduce water pollution |
| Habitats Directive | 92/43/EEC | Protecting 1000+ species and 230 habitat types. MS must take action to prevent deliberate disturbance or damage etc. |
| Birds Directive | 2009/147/EC | First adopted in 1979. Obligation on MS to protect wild birds and protect their habitats. |
| Renewable Energy Directive III | 2023/2413 | Sets sustainability criteria for bioenergy - for either national authorities or private certification to assess - links flagged with carbon removal certification |
| Soil Monitoring Directive | 2023/416 | Harmonised definition of soil health and monitoring methods. LUCAS soil sampling to be extended. |
| Emissions Trading System Directive | 2023/959 | Started in 1.1.2005. Forests originally considered but rejected in 2006, Focus on permanent removal - fire/disease/ wind risks. CDM and JI options post Kyoto |
| COMMUNICATIONS | | |
| Biodiversity Strategy 2030 | COM/2020/380 | Sets a range of targets . some of which were included in the NRR. Accompanied by actions tracker and targets dashboard |
| State Aid Rules for agric and forestry | COM/2022/9120 | Many mentions of carbon farming or carbon sequestration (not sure how this relates to the ABER Regulation?) |
| Forest Strategy 2030 | COM/2021/572 | Vision and actions to improve the quantity and quality of EU forests and strengthen their protection, restoration and resilience - e.g. 3 billion trees and biodiversity sensitive planting |
| Soil Strategy for 2030 | COM/2021/699 | Sets framework and measures for soil health. |
| Zero Pollution Action plan 2050 | COM/2021/400 | Sets key 2030 targets for reducing pollution at source - with action tracker and targets dashboard |
| Climate Adaptation Strategy | COM/2020/82 | How the European Union can adapt to the unavoidable impacts of climate change and become climate resilient by 2050. |

The Green Deal is being
“simplified” Do we need a
new EU “Landscape Strategy”
(covering woody, wet and
herbaceous woody landscape
features)

Tree Desert Landscapes in Europe

Tree-Cover-Density (TCD) on agricultural land in the 39 EEA countries. Areas of white are non-agricultural areas. Red areas are priority planting zones where TCD is particularly low. Source: Copernicus TCD-2018 superimposed on Corine agricultural land for 2018. Each pixel covers 1 ha (100 m x 100 m). The map was produced for the EU DigitAF project by Planet Inc and the European Forest Institute.

POLICY Co-DEVELOPMENT: METHODOLOGY

Step 1: Policy Landscape Mapping
(Oct 2020 – Sep 2021)
23 countries (4 non-EU)

- Scientific papers
- 10 concluding recommendations

Step 2 : Policy Scenario Development
(Oct 2021 – Sep 2022)
in 6 regions

- 8 EIP-style policy factsheets
- 12 concluding recommendations

Step 3 : Multi-stakeholder Policy Co-design
(Oct 2022 – Nov 2023)
in 7 regions
with 14 multi-stakeholder groups

6 concluding recommendations

1. Policy Landscape Mapping: results

- Both national and EU level policies for AF have been **growing incrementally** over recent years
- The Common Agricultural Policy (**CAP**) provides direct support during the 2007-2013 and 2014-2020 periods but still disincentive
- Agroecological elements within CAP policies exist at plot, field and farm level which focus on input substitution rather than systems redesign

We conclude that policies are currently not designed in a cohesive manner and at times work against one another

Transforming food systems towards agroecology – a critical analysis of agroforestry and mixed farming policy in 19 European countries

Jessica Buratti-Donham^a, Rosemary Venn^b, Ulrich Schmutz^b,
and Paola Migliorini^{b,a,c}

ABSTRACT

Agroforestry (AF) and mixed farming (MF) are two multi-functional land use systems that harbor an untapped potential for future climate mitigation, however, they remain outside of the norm. This review collected and analyzed the policy landscape for AF and MF in 19 European countries. The results show that while the policy landscape in Europe has been growing for AF, with support found within the European Union's Common Agricultural Policy and Green Deal, as well as European state policies, direct MF support is largely missing. No country assessed supports AF in its entirety (traditional, establishment, yearly maintenance) although, there are countries like Portugal, which show robust policies for at least one of these aspects. This paper also assessed the degree to which policies found can be considered agroecological, or contributing to an agroecological transition. Our analysis indicates that while agroecological elements do exist in some of the policies, it is currently primarily on plot, field, and farm level, involving input substitution or the change of one practice for another. We conclude that policies are currently not designed in a cohesive manner, and at times work against one another. We therefore recommend that all future policies center themselves on the High-Level Panel of Expert's 13 Principles of Agroecology, as well as on transformative and inclusive policy design frameworks.

1. Policy Landscape Mapping: results

1. Policy Landscape Mapping: 10 recommendations

Think and act systematically towards a common food systems approach

Strengthen regional supply chains

Promote an enabling Environment

Increase agroecological practices

Create incentives to extensively manage livestock

Increase regional research

Integrate long-term thinking

Build agroecological capacity in system

Empower local governments

Promote diversity in knowledge generation

2. Policy scenario development: results

England

France

Germany

Switzerland

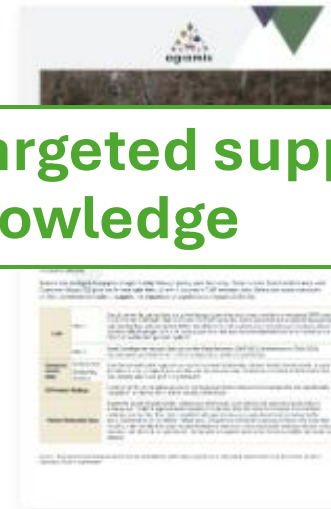

Rhineland

Central – Eastern Europe

EU – Agroecology

EU – Carbonfarming

Unifying results across regions: more targeted support is needed: policy, financing & knowledge

CEEweb –
Agromix policy workshop, Solutions for the CEE region

3. Multi-stakeholder Policy Co-design: results

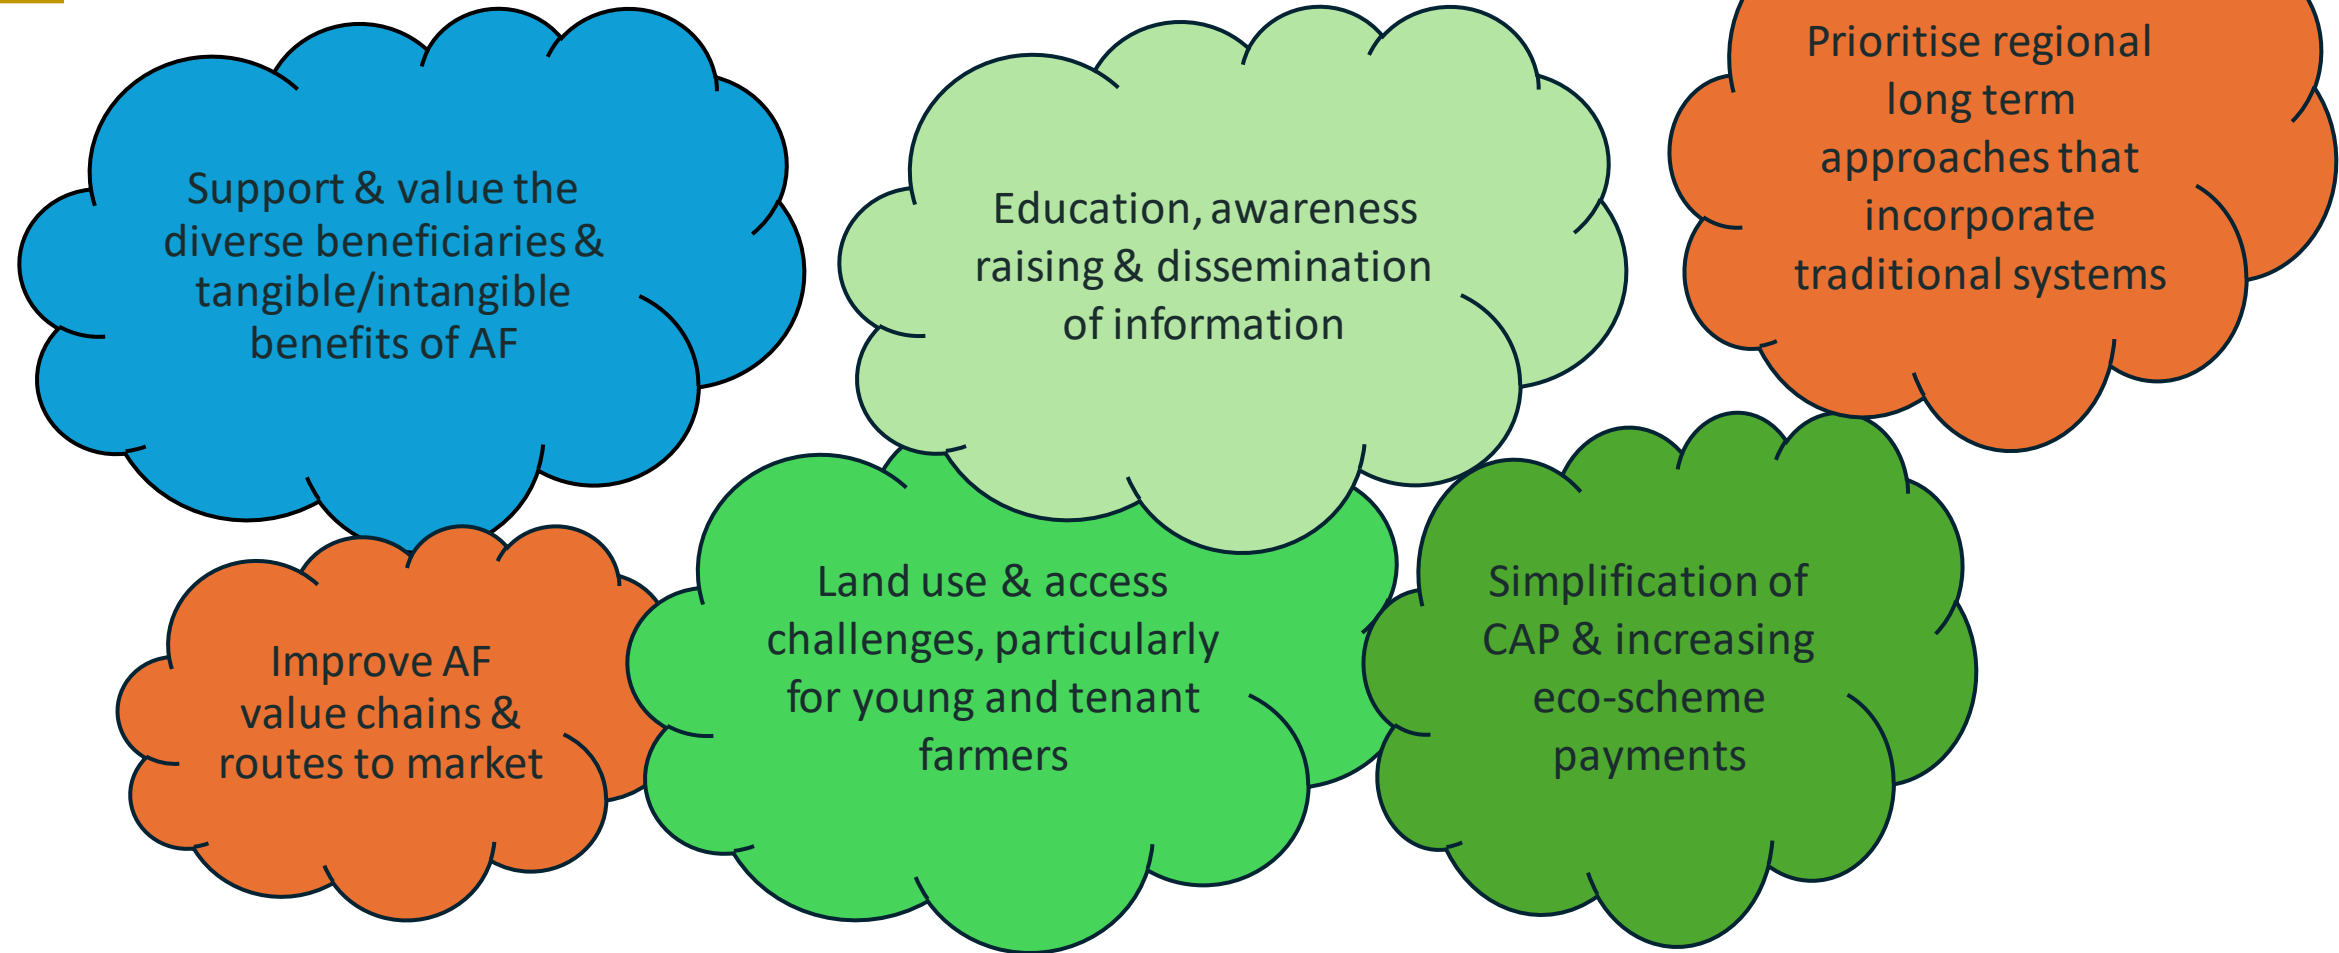

KEY OBSERVATIONS

- Different definitions of agroforestry exist and contradict
- Important to include traditional systems and existing farm woodland
- Tenant farming is an issue across EU for agroforestry uptake

KEY NEEDS

- Education, awareness raising, knowledge & upskilling requirements
- Routes to market
- More evidence & research on economic benefits, long term trials and impact on biodiversity

3. Multi-stakeholder Policy Co-design: categories for policy recommendations

Agroforestry for the Future of European Agriculture
Policy Summit, 17 April 2024

Wrap up and introduction to World Cafe

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement 862993.

Introduction to the WORLD CAFE

Objective of the World Cafe

To express **your point of view** for support for the implementation of agroforestry & mixed farming in EU food systems

How it works

1. *Choose a room:* any 1 of the 4 rooms - they are all the same (max 30p in each)
2. *Choose a table:* there are 5 tables in each room, each representing one of the 5 topics to be discussed
3. *Participate in the Small-Group Round at your table:* Your table-facilitator will provide instruction. 1 round lasts 20 minutes.
4. *Harvest and summarise:* The table-facilitator will gather insights and briefly summarise them to everyone at your table.
5. *Move to the next table:* choose your next table (in the same room) and repeat for 2 more rounds.
6. *Final plenary presentation and sharing:* the facilitators will share some of the results

Table topics

What policies and other measures are required to:

- Improve and condense the many definitions, statistics & tools used within AF/MF
- Develop training resources, improve education & access to research results to foster best practices in AF/MF
- Increase and streamline funding and economic incentives, both within and outside of the CAP
- Improve policy coherence across interconnected policy objectives and strategies at EU level
- Develop diverse value chains for AF/MF products & increase their visibility
